At UTILIS, it's all about cutting. And your success.

future since 1915

For more than 100 years we have been developing, producing and distributing premium quality cutting tools for micromechanics, watch- and medical technology.

UTILIS AG is one of the world's leading suppliers of precision tools for the metal working industry. Ever since the company was founded in 1915 it has been our declared goal to forge ahead in the production of high quality cutting tools for micromechanics that are valuable and beneficial for our customers. For us, as a traditional, mid-sized, family runned Swiss business, it is only natural that we place the greatest value on precision, service and our customers. We consciously decided to produce our multidec® brand products in Switzerland. It is the only way that we can ensure the established and proven quality of UTILIS brand products that we currently sell in 57 countries around the world. A positive side effect: we ensure, create and maintain employment in Switzerland.

2018 – 25 years of multidec®

since 1993

UTILIS
multidec
 swiss type tools

For more than a quarter of a century we have been developing innovative precision tools under our own brand "multidec®", which is specifically designed to meet the challenges of the watch, medical and dental implant industries. By using state-of-the-art, advanced technology and our extensive know-how in the manufacture of our "multidec® product line", we are positioning ourselves as a specialist and as one of the leading companies in the market for cutting tools in the metal cutting industry.

24-hour shopping, information and knowledge – and already more than 25,000 products.

Our e-shop offers you a large range of functions and assistance. Take advantage of the product search or the direct service area that we can fulfil your orders, wishes and suggestions quickly.

www.utilis.com – Visit our e-shop this very day

- An extensive product portfolio
- Multidec® order helper – the guided multidec® product search
- UTILIS service area – quick search, contacts and assistance
- UTILIS adviser
- Tools, information and more

Innovative precision tools – new in this catalogue.

We develop and manufacture innovative solutions and precise cutting tools for you in the micromechanics area. Our claim? Superior quality and performance. We set ourselves challenging tasks in order to make use of our solutions and enhance our reputation as an innovative company. You will find the following innovations (as well as many “new” additions to the range) in this multidec® general catalogue.

... □ 46

TWIN holder, the tool for more flexibility with double cutting edges in one holder.

... □ 46

Y-AXIS holder for machining to a position that is offset by 90°.

... □ 204

FC holder (fast change) with facility for clamping the indexable insert from the rear.

... □ 494

multidec®-SHORT holder (short version) with optimally directed, integrated “IC” coolant supply.

... □ 139

Full profile threading inserts “VP-S” with reinforced thread profile.

... □ 366

Drill product line from multidec®-DRILL with high performance drills.

... □ 360

multidec®-BROACH polygonal and TORX impact tools.

... □ 386

multidec®-GRAVER engraving tool, finished ground or as semifinished product.

The sustainable profit of your company is at the cutting edge.

We have a market-oriented strategy which makes the sustainable benefit of our customers the main focus of our actions. We stand by our claim of being better than the competition. Within the scope of our corporate strategy, both global networking and direct presence play a decisive part on all of the markets that are relevant to us. We are therefore anxious to make our own multidec® brand comprehensive available directly on site via our international representatives. The enclosed general catalogue is excellent for this purpose—as well as personal discussions and our e-shop.

We wish you every success with our multidec® products, and we welcome you to UTILIS

Mario Macario, Managing Director (CEO)

Different information about multidec® application refer to certain machining methods. In addition, simple symbols inform of the product assortment and where additional products and technical information can be found.

Dimensions

All dimensions are in millimeter (mm); native dimensions in inch are calculated into millimeter.

Categorization of materials

The information on using multidec® tools refers to certain materials. The materials to be machined are categorized in the same color throughout the entire catalog:

Steel (non-alloyed, low alloyed and high alloyed)

Stainless steel

Titanium and Ti-alloys

Non-ferrous metals (gold, aluminum and brass)

Order designation

To the designation of the selected type of product, the desired cutting material code must be added. Supplementing information to the grades can be found according to the page references (□ ...).

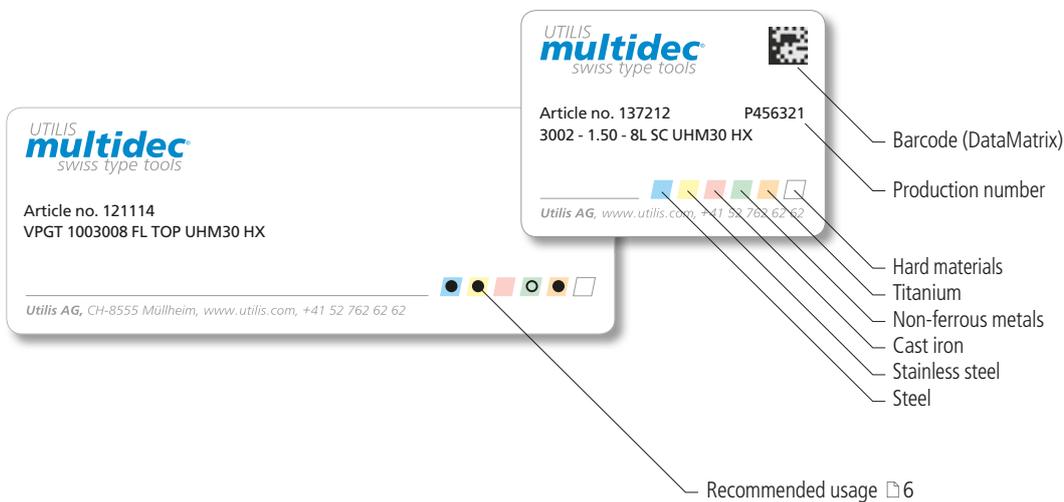

| Order designation | | Carbide □ 19 | | |

Packaging information

The product labels illustrate the content of the packaging and also show the materials on which the cutting insert can be used. For this purpose, UTILIS uses the ISO standard coding.

The UTILIS article number is generally also printed as a barcode on the UTILIS (multidec®) product packaging.

Legend

Execution of holder/insert

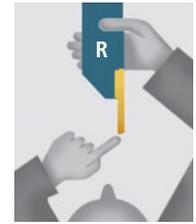

The side on which the insert is located determines whether it is a "left-" or "right-hand" holder. For this purpose, the holder is viewed with the insert pointing towards the observer.

Left hand holder

Neutral holder

Right hand holder

Pictures

The right-hand version of the tools is usually shown. (Exceptions are possible). The tool colours illustrated here are not binding.

Product lines and accuracy classes of UTILIS

To meet today's requirements of modern production it is not necessary to use the most accurate – but to use the tools adapted to the requirements. This means, the more accurate and sophisticated the process, the higher must be the accuracy of the produced tools. Therefore, the product range has been divided into three different accuracy classes. Your advantage: you buy the quality, which is effectively required.

| Product line | | Description |
|----------------------|--|---|
| PREMIUM-LINE | | The PREMIUM-LINE includes UTILIS tools with the highest accuracy requirements, especially for the production of micro parts. Tightest dimensional tolerances, precisely executed, highest surface quality and high repeatability are the features of this line. |
| STANDARD-LINE | | The STANDARD-LINE meets the highest demands on the quality, which is demanded for Swiss type tools in production of small parts. Tight dimensional tolerances and high surface quality are implemented. These are quality standard tools, which are very well positioning this line in a wide range of applications. |
| VALUE-LINE | | The VALUE-LINE is based on the known positions of our STANDARD-LINE. The most important functional elements – such as inserts and holders – are manufactured with the normal dimensional tolerances seen in the industry. Designed for the production of low-cost components, this line offers optimal quality standards. |

Application range for diamond □ 22

With the refinement of cutting tools with an additional coating the wear will be decisively reduced. Rubbing, warming up, diffusion and oxidation decreases significantly.

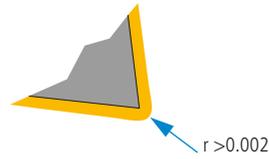

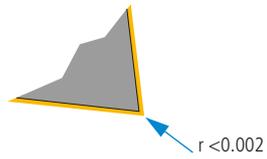

Cutting process without coated tool

Cutting process with coated tool

Rounded edges among coated inserts

Every coating of a carbide insert results in a rounded cutting edge. The smaller the diameter of the material to be cut, the more significant are the consequences in the cutting performance. Therefore the rounding off of the cutting edge depends on the thickness of the coated layer. As thicker the coating, as greater is the radius created along the cutting edge.

Properties and application range of coatings

| Standard allround coating for finishing and micro-finishing operations on a wide range of materials. | | | | | | | | | | |
| Standard allround coating for roughing and finishing operations in steel and stainless steel. | | | | | | | | | | |
| Coating for the machining of steel materials for slow and medium cutting speeds. Not recommended for highly heat resistant materials. | | | | | | | | | | |
| Coating with extreme hardness and outstanding toughness. Extremely suitable for steel, stainless steel and conditionally for titanium, at slow cutting speeds. | | | | | | | | | | |
| Universally usable coating for dry and wet machining at fast cutting speeds in steel, stainless steel and titanium. | | | | | | | | | | |
| High-performance coating for micro finishing operations in steel and stainless steel. Recommended for sharp edges, which are used in micro machining. | | | | | | | | | | |
| High-performance coating for micro finishing and finishing operations in stainless steel and highly heat resistant materials as well as micro cutting of hardened steels up to 70 HRC. | | | | | | | | | | |
| Diamond coating for non-ferrous metals. Recommended for aluminium, plastic, brass and copper. | | | | | | | | | | |
| High performance diamond coating for non-ferrous metals. Recommended for aluminium alloys, platinum, silver, gold, composites and reinforced synthetics | | | | | | | | | | |

The exceptional hardness of diamonds in the various tool versions enables much higher cutting parameters to be achieved compared when conventional cutting materials are used.

In addition to traditional grinding and erosion machining, the use of high tech lasers not only produces top quality cutting edges, but also enables 3D chip removal geometries to be obtained.

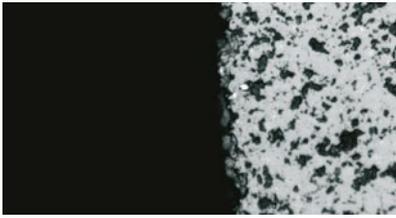

UPCD15 / UPCD20

UPCD (polycrystalline diamond) is a sintered diamond powder in a metallic bonding matrix. Its grain structure ranging from ultra-fine (UPCD20) to coarse (UPCD15) gives the UPCD varying degrees of toughness, so greatly extending the range of possible applications.

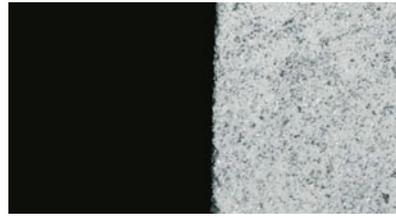

With its diamond content of around 90 % only, UPCD has a much lower hardness and hence wear-resistance than UCVD.

Suitable for the following materials:

- Aluminum with 8–20 % SiC
- Brass, copper and bronze
- Platinum and gold

UPCD15

UPCD20

UCVD08

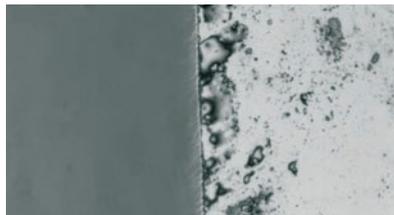

This diamond is produced by the CVD technique with a thickness of 0.8 mm. No binder is used. Minute diamond crystals are separated from the gas phase into a thick polymer diamond substrate which consists of up to 99.9 % diamond material.

Because of its high wear resistance, the life time of this innovative cutting material is between 2 and 10 times longer than that of UPCD.

The extremely sharp cutting edge enables reduced cutting pressure to be applied, therefore achieving excellent surface quality.

Suitable for the following materials:

- CFK... up to 80 % carbon fiber
- GFK... up to 80 % glass fiber
- Plastics
- Aluminum with 8–20 % SiC
- Brass, copper and bronze
- Platinum and gold

UCVD08

For the definition of surface roughness measured values are defined by DIN-ISO. In particular it means:

- Single surface roughness depth $Z_1 \dots Z_5$
This is the vertical distance between the highest and the lowest point of the roughness profile R within a single measured length l_e .
- Average roughness depth R_z (DIN 4768)
This is defined as the average value resulting from the single roughness depths of five successive single measured lengths l_e .
- Average roughness value R_a (DIN 4768)
This is defined as the arithmetical mean of the absolute sums of the roughness profile R within the entire measured length l_m .
- Max. surface roughness depth R_t (DIN 4768/1)
This is the distance between the elevation and depression of the line within the measured length (reference distance) of profile filtered according to DIN 4768 sheet 1.

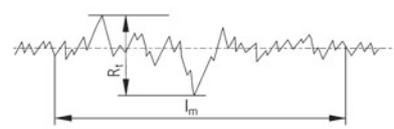

Average roughness value R_a

Single surface roughness depth Z

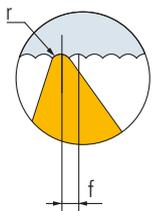

Maximum surface roughness R_t

Theoretical surface roughness

r = Corner radius (mm)
 R_t = Theoretical surface roughness (μm)
 f = Feed (mm)

Standard design

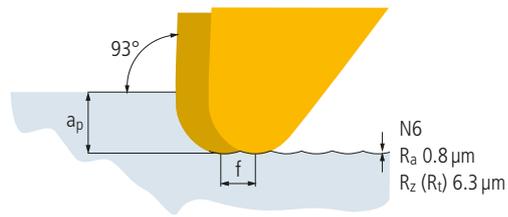

– $r = 0.05\text{mm}$ – $r = 0.10\text{mm}$ – $r = 0.20\text{mm}$ – $r = 0.40\text{mm}$ – $r = 0.80\text{mm}$

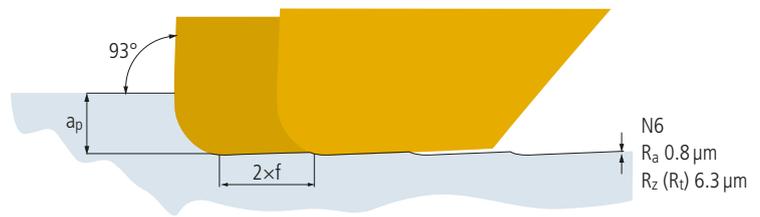

Improvement of feed rate by drag-cut with TOP System

By using the TOP system with drag-cut and a 93° holder the feed rate can be increased up to 2 times. This way the machining time can be decreased significantly by keeping the same quality. On the other hand within the same machining time the surface roughness can be improved clearly.

The following example illustrates the principle exactly.

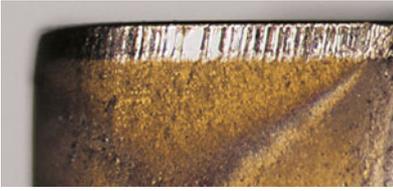

Holder 93°
Corner radius 0.8 mm

Holder 93°
Corner radius 0.8 mm
multidec®-TOP insert

A Flank wear

Reasons:

- Cutting speed too high
- Carbide grade with too little wear resistance
- Feed rate not adapted

Remedies:

- Reduce cutting speed
- Select better wear resistant carbide grade
- Adapt feed rate to cutting speed and cutting depth (increase feed rate)

Abrasion on flank, normal wear after a certain machining time.

B Edge chipping

Reasons:

- Grade with too high wear resistance
- Vibrations
- Feed rate too high or excessive cutting depth
- Interrupted cut
- Swarf damage

Remedies:

- Use tougher carbide grade
- Use negative cutting edge geometry with chip groove
- Increase stability (tool and work piece)

Through excessive mechanical stress at the cutting edge fracture and chipping can take place.

C Cratering

Reasons:

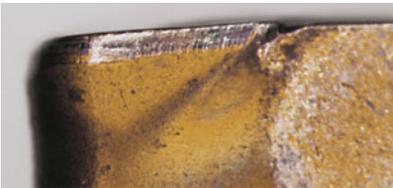

- Too high cutting speed and/or feed rate
- Rake angle too shallow
- Carbide grade with little wear resistance
- Insufficient coolant supply

Remedies:

- Reduce cutting speed and/or feed rate
- Increase coolant quantity and/or pressure, optimize coolant supply
- Use carbide grade which is more resistant to cratering

The hot chip which is being evacuated causes cratering at the rake face of the cutting edge.

D Plastic deformation

Reasons:

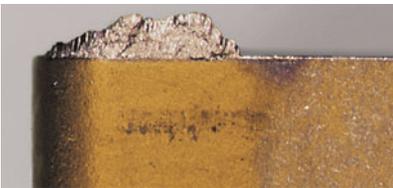

- Too high machining temperature, resulting in softening of substrate
- Damaged coatings

Remedies:

- Reduce cutting speed
- Choose carbide grade with higher wear resistance
- Provide cooling

High machining temperature and simultaneous mechanical stress can lead to plastic deformation.

E Built-up edges

Reasons:

- Too low cutting speed
- Too small rake angle
- Wrong cutting material
- Lack of cooling/lubrication

Remedies:

- Increase cutting speed
- Enlarge rake angle
- Select more resistant coating
- Use emulsion with higher concentration

Built-up material/edges occur when the chip is not evacuated properly due to a too low cutting temperature.

F Insert breakage

Reasons:

- Excessive stress of cutting material
- Lack of stability
- Corner angle too small
- Excessive notching

Remedies:

- Use tougher carbide grade
- Use protective edge chamfer
- Increase honing of cutting edge
- Use more stable geometry

Excessive stress of the insert causes breakage.

| Remedy/Measure | | | | | | | | | | | |

🔍 inspect, optimise

The cutting temperature particularly the wear depends significantly on the cutting conditions (v_c , f and a_p). Thermal causes of wear like oxidation and diffusion increase disproportionately.

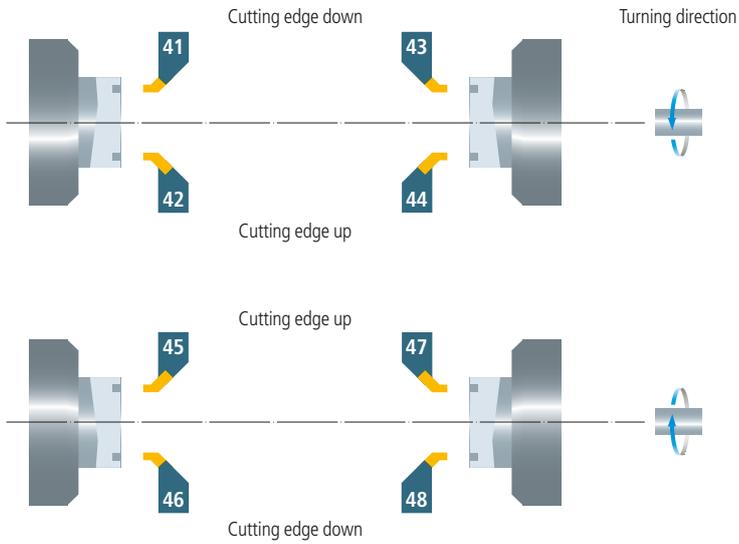

With the illustration below it is possible to achieve up different tooling situations. Choose yours and we will recommend you the suitable tooling solution.

Execution of holder/insert

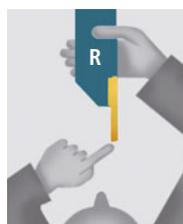

The side on which the insert is located determines whether it is a "left-" or "right-hand" holder. For this purpose, the holder is viewed with the insert pointing towards the observer.

Left hand holder

Neutral holder

Right hand holder

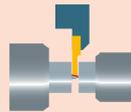

multidec®-CUT is most commonly used in OD-turning or alternatively in ID-turning. 5 systems are distinguished by the cutting depth or width and application field of machining process. All inserts are replaceable very easy and known for its great repeat accuracy. For cutting of all common materials we offer ideal adjusted micrograin carbides grades (K10–K40 PVD coated and uncoated).

The turn and cut-off system 500 is suitable for Swiss type cam lathes up to bar diameter 15mm. The neutral cutting inserts, only available as blanks, consist of one cutting edge and will be mounted on tool holders with a repeatability of <math>< 0.01\text{ mm}</math>. Even for the ground, hardened and nickel plated holders a wide range of possibilities with shank sizes between 6 and 10 mm are available. For Swiss-type automatic lathes special holders have been designed and complete the wide range of choices.

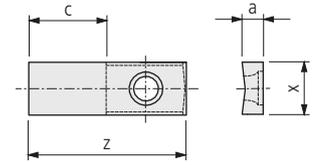

**Advantages:**

- Replace brazed tools on cam machines
- Neutral inserts with mirror polished cutting face
- Coated and uncoated blanks available
- The machine operator can grind his own cutting geometries

TORX screwdriver 664

The turn and cut-off system 1600 is suitable for Swiss type lathes up to bar diameter 10 mm. The cutting inserts consist of two cutting edges. Even for the holders a wide range of possibilities with shank sizes between 7 and 25 mm are available. For Swiss-type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- Large selection of cutting geometries with different chip breakers especially made for smallest parts
- Full profile threading inserts starting from M 0.2 (0.06 mm pitch)
- Grooving inserts width starting from 0.05 mm

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Fixed coolant exit allows for small set-up in front of the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

"TWIN" holder with and without integrated coolant supply

The "TWIN" range allows you to work with two inserts on the same holder. Different combinations are possible, and provide the user with a high degree of flexibility. Holders are available with shank cross-sections of 8 to 20 mm, with and without internal cooling.

Advantages:

- Twice the number of tools on the machine
- Two different turning operations are possible with a single tool holder
- All holders with an integrated coolant supply have five connecting options

"Y-AXIS" holder with and without integrated coolant supply

Y-AXIS holders solve the chip control problems that can occur when cutting long-chip materials. With the Y-AXIS holder, the cutting edge is offset by 90° compared to the standard holder, whereby the chips fall in the bed of the machine. This prevents troublesome tumbling and flowing chips that can become caught on the cutting edge and damage it.

Benefits:

- Suitable for long chipping materials
- The problem of chip control is solved
- Holders with internal cooling
- All holders feature five possible connectors for the coolant supply

**Product description**

Development and production of multidec® tools for your own specific needs.

Customer's situation

A special machining method makes it impossible or difficult to use tools from the standard multidec® range. You need a special insert, a special tool or coating which is not included in our standard product range.

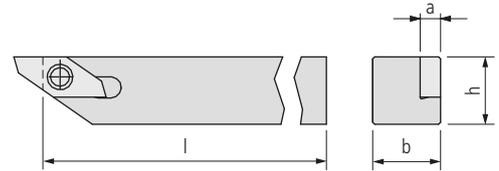

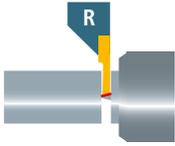

UTILIS solution

After detailed consultation, we will develop and make the best multidec® solution for your particular needs. Normally this will be done using standard blanks which enable the special tools to be produced and delivered quickly and at reasonable cost. The familiar multidec® quality is of course always guaranteed.

Advantages:

- UTILIS know-how and quality also for special tools
- Standard blanks permit fast and reasonably priced delivery
- Tools developed to meet your specific needs

Usage notes:

To avoid problems, two Y-Axis holders must not be mounted directly next to each other.

Mount a standard tool holder between the Y-Axis holders.

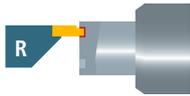

To prevent collisions, move back the holder in accordance with the overhanging length before changing the tool position.

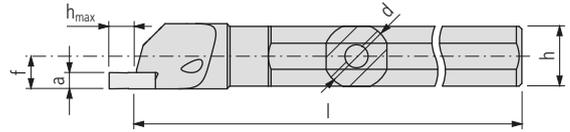

Scope of delivery: Holder without coolant connector

TORX screwdriver □ 664

The turning system 1700 ideally complements the existing system 1600. The inclined position of the insert in the holder enables the tool to pass close to complex shapes with no risk of collision. The inserts consist of two cutting edges. Even for the holders a wide range of possibilities with shank sizes between 8 and 20 mm are available. For Swiss-type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- Tool holder clearance given from insert seat
- Grooving inserts width starting from 0.05 mm
- "WCT" threading program for turning NIHS 60-30 threads in watch cases

UTILIS
multidec[®]
swiss type tools**Product description**

Development and production of multidec® tools for your own specific needs.

Customer's situation

A special machining method makes it impossible or difficult to use tools from the standard multidec® range. You need a special insert, a special tool or coating which is not included in our standard product range.

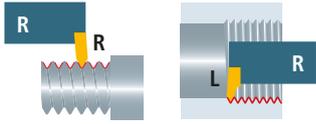

UTILIS solution

After detailed consultation, we will develop and fabricate the best multidec® solution for your particular needs. Normally this will be done using standard blanks which enable the special tools to be produced and delivered quickly and at reasonable cost. The familiar multidec® quality is of course always guaranteed.

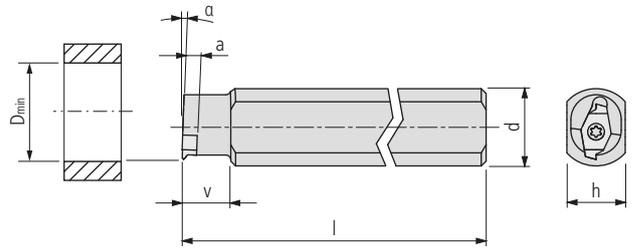

Advantages:

- UTILIS know-how and quality also for special tools
- Standard blanks permit fast and reasonably priced delivery
- Tools developed to meet your specific needs

For external and internal turning

| Illustration | Description | Dimensions | Order designation | | Holder |
|---|-------------|--------------|-------------------|---|---------|
|  | TORX screw | M2.5 × 6 T08 | MSP 25060 T08 | ■ | 1700... |

TORX screwdriver  664

A turn and cut-off tool system for Swiss type lathes up to bar diameter 32 mm. The cutting inserts consist of two cutting edges. The insert seat, which is protected against contamination permits 100 % utilization of all cutting edges.

Even for the holders a wide range of possibilities with shank sizes between 8 and 25 mm are available. For Swiss-type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- Large selection of insert geometries with different chip breaker geometries
- Special chip breaker design for machining of small to mid-sized work pieces
- Perpendicularity guaranteed by two fixing screws, large support face and a genuine stop face for axial positioning
- The cutting forces are transferred directly from the insert to the holder; the screws are therefore not exposed to shear stress
- Inserts can be reground
- 2nd edge still usable after the first has crashed

Chip breaker "GS"

This insert with the chip breaker "GS" was developed using a revolutionary new manufacturing technology. Geometry, carbide and coating are perfectly matched to cut off all materials. The result is a cut-off insert which will increase your productivity enormously.

Advantages:

- Optimally tuned carbide and coating for high cutting speeds
- Good chip control by special chip breaker
- For high feeds
- Rounded cutting edge "E" for steel and easily machineable stainless steel
- Sharp cutting edge "F" for super-alloys, non-ferrous metals and stainless steels which are difficult to machine
- Can be used on all holders of the multidec®-CUT 3000 series
- Reasonably priced

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Fixed coolant exit allows for small set-up in front of the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

**Product description**

Development and production of multidec® tools for your own specific needs.

Customer's situation

A special machining method makes it impossible or difficult to use tools from the standard multidec® range. You need a special insert, a special tool or coating which is not included in our standard product range.

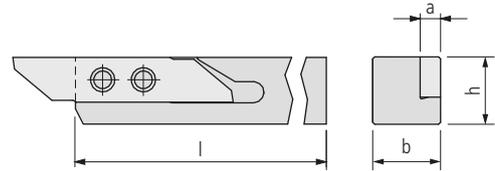

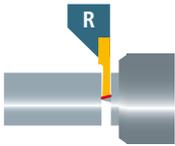

UTILIS solution

After detailed consultation, we will develop and make the best multidec® solution for your particular needs. Normally this will be done using standard blanks which enable the special tools to be produced and delivered quickly and at reasonable cost. The familiar multidec® quality is of course always guaranteed.

Advantages:

- UTILIS know-how and quality also for special tools
- Standard blanks permit fast and reasonably priced delivery
- Tools developed to meet your specific needs

Clamping of the insert on holder 3000...C □ 153

The regular tool holder multidec®-CUT 3000 uses the insert fixing screws from the side of the insert. The tool holder CUT 3000 C "Combi" allows in addition the insert fixing screws to be mounted from the opposite side using tapped bushings.

To avoid damage don't use excessive force while inserting and removing the tapped bushing.

Replacement and spare parts

C: Combi; A: offset shank

* Holder up to shank width of 8 mm

** Holder from shank width of 10 mm

TORX screwdriver  664

A turn and cut-off tool for Swiss type lathes up to bar diameter 20 mm. The cutting inserts consist of two cutting edges. The insert seat, which is protected against contamination permits 100% utilization of all cutting edges.

Even for holders a wide range of possibilities with shank sizes between 8 and 25 mm are available. For Swiss type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- System for grooving large and wide forms up to 6 mm
- The machine operator can grind his own cutting geometries

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Fixed coolant exit allows for small set-up in front of the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

**Product description**

Development and production of multidec® tools for your own specific needs.

Customer's situation

A special machining method makes it impossible or difficult to use tools from the standard multidec® range. You need a special insert, a special tool or coating which is not included in our standard product range.

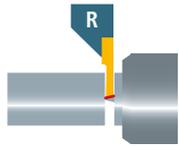

UTILIS solution

After detailed consultation, we will develop and make the best multidec® solution for your particular needs. Normally this will be done using standard blanks which enable the special tools to be produced and delivered quickly and at reasonable cost. The familiar multidec® quality is of course always guaranteed.

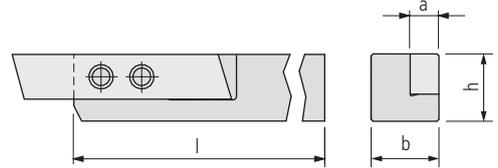

Advantages:

- UTILIS know-how and quality also for special tools
- Standard blanks permit fast and reasonably priced delivery
- Tools developed to meet your specific needs

Properties and applications

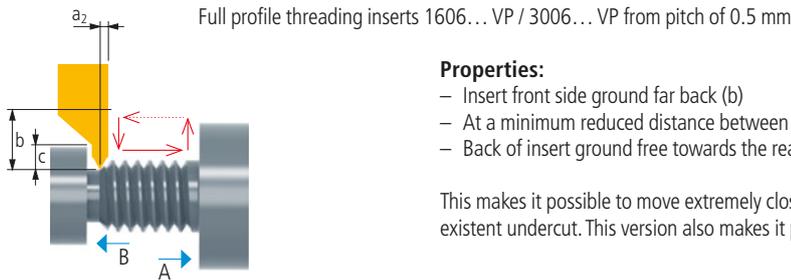

164

Properties:

- Insert front side ground far back (b)
- At a minimum reduced distance between the thread tip and front side (a_2)

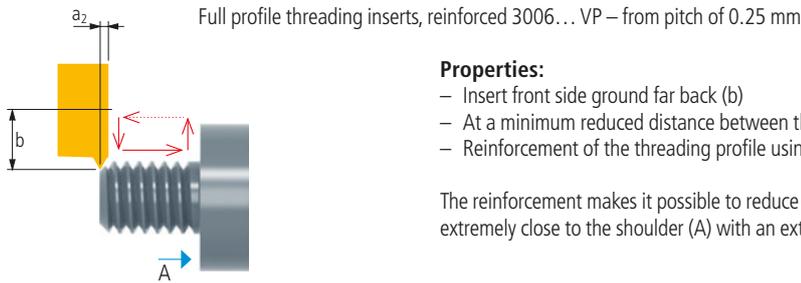

This makes it possible to move extremely close to the shoulder (A) with an extremely narrow or non-existent undercut.

Properties:

- Insert front side ground far back (b)
- At a minimum reduced distance between the thread tip and front side (a_2)
- Back of insert ground free towards the rear (c)

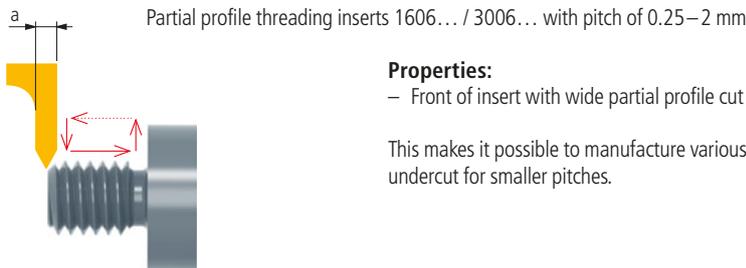

This makes it possible to move extremely close to the shoulder (A) with an extremely narrow or non-existent undercut. This version also makes it possible to manufacture a thread behind a shoulder (B).

Properties:

- Insert front side ground far back (b)
- At a minimum reduced distance between the thread tip and front side (a_2)
- Reinforcement of the threading profile using a special cut

The reinforcement makes it possible to reduce the number of passes by up to 20%. It is possible to move extremely close to the shoulder (A) with an extremely narrow or non-existent undercut.

Properties:

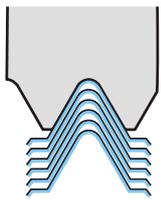

- Front of insert with wide partial profile cut (a) for covering a bigger pitch area

This makes it possible to manufacture various pitches with the same indexable insert, but requires an undercut for smaller pitches.

Number of passes

| Pitch | (mm) | 0.06–0.09 | 0.1–0.35 | 0.4 | 0.45 | 0.5 | 0.75 | 0.8 | 1 | 1.25 | 1.5 | 1.75 | 2–2.5 |

| Non-ferrous metal | | 2–4 | 3–5 | 3–6 | 3–7 | 3–8 | 4–9 | 5–10 | 6–11 | 7–14 | 8–16 | 8–16 | 17–22 |

Choice of feed movement

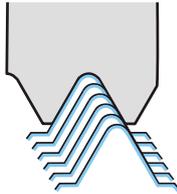

Radial feed

Applicability:

- For conventional lathes
- For pitches < 2 mm
- Short chipping materials

Disadvantage:

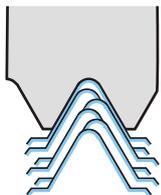

- Poor chip control

Feed on the flanks

Applicability:

- For CNC lathes
- For pitches 2 to 4 mm
- Long chipping materials
- Good chip control

Alternated feed

Applicability:

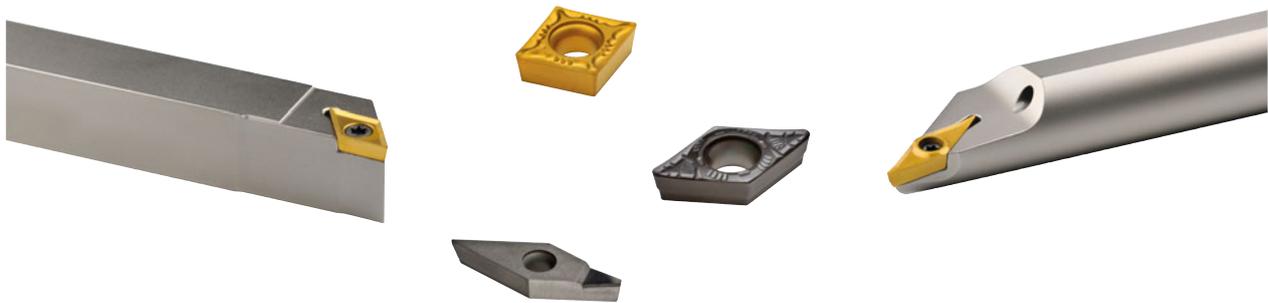

- For pitches > 4 mm
- Long chipping materials
- Regular wear of insert
- High tool-life
- Good chip control

Disadvantage:

- Complex CNC-programming

multidec®-ISO provides a very wide range of ISO standardized inserts for Swiss type machining and precision turning. All inserts consist of two or more edges and are easily indexed or changed.

At the same time multidec®-ISO provides a very stable and sharp cutting edge with a maximum radius between 0 and 0.8 mm. Innovative solutions involving coated and uncoated inserts made of carbide, cermets and diamond tips have been designed to cut very difficult materials. For all mechanical cutting conditions a large choice of sintered and ground inserts with a wide variety of chip grooves are available. Even for the holders a wide range of possibilities with shank sizes between 8 and 25 mm are available. For Swiss type automatic lathes special holders have been designed and complete the wide range of choices.

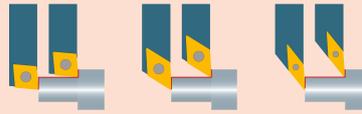

Advantages:

- Large range of standard ISO inserts
- Sharp cutting edges "F"
- Rounded cutting edges "E"
- Small corner radius (0-0.80 mm)
- Especially designed holders for CNC Swiss type automatic lathes (sizes 8x8 to 25x25 mm)

multidec®-ISO provides a well balanced range of tools for turning with rhombic 80° inserts and holders. Positive inserts with rounded cutting edges for roughing and sharp cutting edges for finishing are available.

These include a wide range of ground holders with hardened and nickel-plated surfaces for Swiss type automatic lathes with shank sizes from 8 to 20 mm and boring bars with diameters from 8 to 20 mm.

Advantages:

- High cutting volume with high feed rates
- Carbide and Cermet grades with chip breaker and coatings for all common materials
- Diamond range with CVD and PCD inserts for machining non-ferrous metals
- Cutting edge radius from 0.03 to 0.8 mm as standard
- Boring bars with steel- and carbide shank

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

Application range of chip breaker

- Properties:**
- polished rake
 - ground clearance
 - sharp cutting edge "F"
 - micrograin carbide, heat and wear resistant

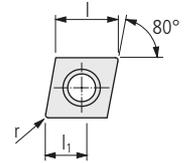

- Application:**
- micro finishing
 - chip breaker for materials with difficult chip control
 - stainless steel, alloyed steel, titanium, super alloy, aluminum and synthetics reinforced/composites

Application range of chip breaker

Properties:

- sintered insert based on ISO standard
- rounded cutting edge "E"
- micrograin carbide

Optimal chip breaking

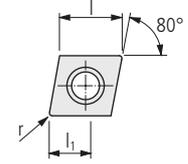

Application:

- roughing and finishing
- chip breaker for general application
- alloyed steel and stainless steel

Application range of chip breaker

- Properties:**
- sharp cutting edge "F"
 - less cutting force
 - positive cut

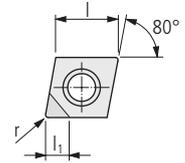

Optimal chip breaking

- Application:**
- finishing and micro finishing for unstable or thin-walled parts
 - chip breaker for general application will generate continuous chip
 - aluminum, brass, copper, bronze, platinum, gold, synthetics and synthetics reinforced/composites
 - Ideal for smallest tolerance and medium surface quality

Application range of chip breaker

- Properties:**
- sharp cutting edge "F"
 - higher cutting force
 - high positive wide chip breaker made by laser

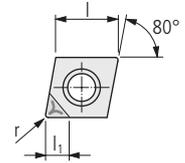

Optimal chip breaking

- Application:**
- finishing for stable or solid parts
 - chip breaker for materials with difficult chip control
 - synthetics reinforced/composites, aluminum, platinum, gold and synthetics
 - Ideal for smallest tolerance and best surface quality

multidec®-ISO provides a well balanced range of tools for turning with rhombic 55° inserts and holders. Positive inserts with rounded cutting edges for roughing and sharp cutting edges for finishing are available.

These include a wide range of ground holders with hardened and nickel-plated surfaces for Swiss type automatic lathes with shank sizes from 8 to 20 mm and boring bars with diameters from 10 to 20 mm.

Advantages:

- Carbide and Cermet grades with chip breaker and coatings for all common materials
- Diamond range with CVD and PCD inserts for machining non-ferrous metals
- Cutting edge radius from 0.03 to 0.8 mm as standard
- Boring bars with steel- and carbide shanks

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

"TWIN" holder with and without integrated coolant supply

The "TWIN" range allows you to work with two inserts on the same holder. Different combinations are possible, and provide the user with a high degree of flexibility. Holders are available with shank cross-sections of 8 to 20 mm, with and without internal cooling.

Advantages:

- Twice the number of tools on the machine
- Two different turning operations are possible with a single tool holder
- All holders with an integrated coolant supply have five connecting options

"FC" holder with quick cutting edge change system (fast change)

The cutting edge can be changed without unclamping the holder using the "FC" holder. The indexable insert is mounted using a specially developed knee lever which is operated using a clamping screw on the rear of the holder.

Advantages:

- Quick indexable insert change directly in the machine
- Holder with and without integrated coolant supply

Inserts (carbide / cermet)

Application range of chip breaker

- Properties:**
- polished rake and ground clearance
 - sharp cutting edge "F"
 - micrograin carbide, heat and wear resistant
 - TOP system, for a better surface finish

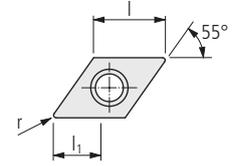

- Application:**
- finishing for 20–100 % higher feed rates compared to the standard
 - chip breaker for materials with difficult chip control
 - stainless steel, alloyed steel, titanium, super alloy, aluminum and synthetics reinforced/composites

Application range of chip breaker

Properties:

- sintered insert based on ISO standard
- rounded cutting edge "E"
- carbide and cermet in different grades

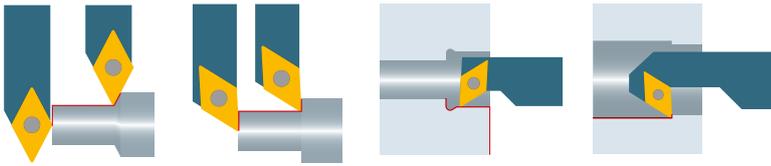

Optimal chip breaking

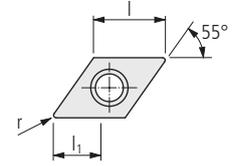

Application:

- roughing
- chip breaker for general application
- alloyed steel and stainless steel

Application range of chip breaker

- Properties:**
- sharp cutting edge "F"
 - less cutting force
 - positive cut

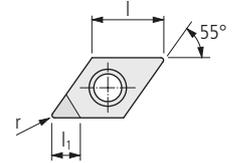

Optimal chip breaking

- Application:**
- finishing and micro finishing for unstable or thin-walled parts
 - chip breaker for general application will generate continuous chip
 - aluminum, brass, copper, bronze, platinum, gold, synthetics and synthetics reinforced/composites
 - Ideal for smallest tolerance and medium surface quality

Spare parts (clamping bolts/screws) □ 203

* Note

With this holder, the indexable insert is secured with a screw using a knee lever that can be operated from behind. This means the holder does not have to be unclamped to change the cutting edge.
 Tighten the clamping screw to 1.2 Nm using a torque screwdriver.

TORX screwdriver  664

This further development of multidec®-ISO provides a tool system with 4 cutting edges and the finest performance-cost ratio for Swiss type machining and precision turning. The insert consist of 4 sharp cutting edges with radius 0.08 and 0.15 mm and is easily indexed or changed. Innovative chip breakers have been designed for cutting of very difficult materials on finishing and micro-finishing applications using coated and uncoated submicrograin carbide. Even for the hardened and nickel-plated holders a wide range of possibilities with shank sizes between 10 and 25 mm are available. For Swiss type automatic lathes special holders have been designed and complete the range of choices.

Specific features of insert DNGU:

- Negative holder fixed with screw
- 4 positive cutting edges for the price of 2
- Sharp edges with 7° clearance angle
- Small corner radius (0.08 and 0.15 mm)
- Fine grain grade carbide
- Insert DNGU also usable on holders with toggle setting device

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

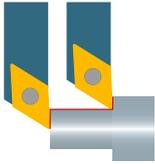

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

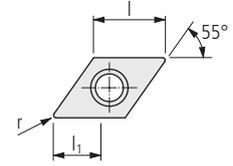

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

STANDARD-LINE

Application range of chip breaker

Properties:

- polished rake and ground clearance
- 4 sharp cutting edge "F"
- submicrograin carbide, high toughness
- best performance-cost ratio

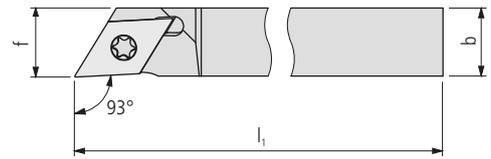

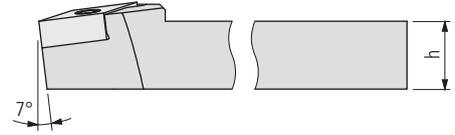

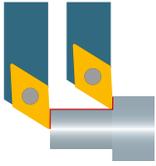

Optimal chip breaking

Application:

- micro finishing
- chip breaker for general application
- alloyed steel and stainless steel

multidec®-ISO provides a well balanced range of tools for turning with rhombic 35° inserts and holders. Positive inserts with rounded cutting edges for roughing and sharp cutting edges for finishing are available.

These include a wide range of ground holders with hardened and nickel-plated surfaces for Swiss type automatic lathes with shank sizes from 8 to 20 mm and boring bars with diameters from 12 to 20 mm.

Advantages:

- Carbide and Cermet grades with chip breaker and coatings for all common materials
- Diamond range with CVD and PCD inserts for machining non-ferrous metals
- Cutting edge radius from 0.05 to 0.8 mm as standard
- Boring bars with steel- and carbide shanks

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

"TWIN" holder with and without integrated coolant supply

The "TWIN" range allows you to work with two inserts on the same holder. Different combinations are possible, and provide the user with a high degree of flexibility. Holders are available with shank cross-sections of 8 to 20 mm, with and without internal cooling.

Advantages:

- Twice the number of tools on the machine
- Two different turning operations are possible with a single tool holder
- All holders with an integrated coolant supply have five connecting options

Application range of chip breaker

- Properties:**
- polished rake and ground clearance
 - sharp cutting edge "F"
 - micrograin carbide, heat and wear resistant
 - TOP system, for a better surface finish

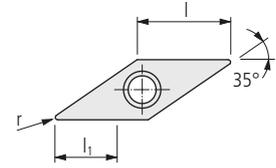

Optimal chip breaking

- Application:**
- finishing for 20-100% higher feed rates compared to the standard
 - chip breaker for materials with difficult chip control
 - stainless steel, alloyed steel, titanium, super alloy, aluminum and synthetics reinforced/composites

Application range of chip breaker

Properties:

- sharp cutting edge "F"
- higher cutting force
- high positive wide chip breaker made by laser

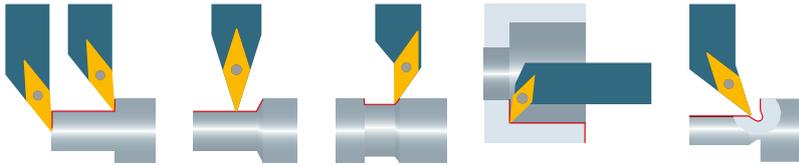

Optimal chip breaking

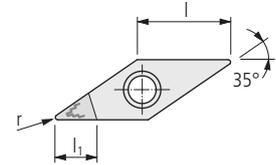

Application:

- finishing for stable or solid parts
- chip breaker for materials with difficult chip control
- synthetics reinforced/composites, aluminum, platinum, gold and synthetics
- Ideal for smallest tolerance and best surface quality

STANDARD-LINE

Application range of chip breaker

Properties:

- sharp cutting edge "F"
- higher cutting force
- high positive wide chip breaker made by laser

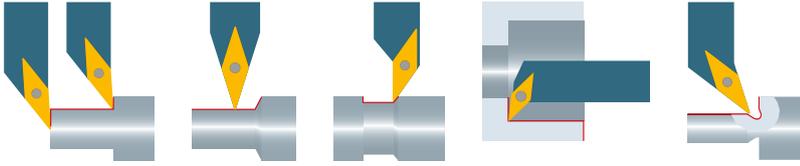

Optimal chip breaking

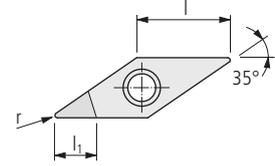

Application:

- machining of massive or solid parts
- chip breaker for materials with difficult chip control
- synthetics reinforced/composites, aluminum, platinum, gold and synthetics
- maximum metal removal rate

Application range of chip breaker

Properties:

- sharp cutting edge "F"
- medium cutting force
- neutral cut

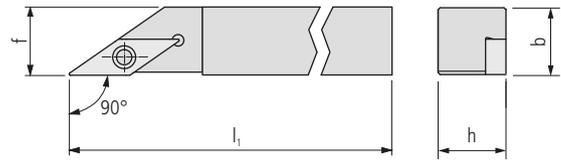

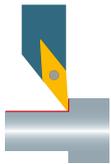

Optimal chip breaking

Application:

- finishing and micro finishing for stable or solid parts
- chip breaker for general application will generate continuous chip
- aluminum, brass, copper, bronze, platinum, gold, synthetics and synthetics reinforced/composites
- Ideal for smallest tolerance and high surface quality

TORX screwdriver  664

The "TOP" system with drag-cut permits an increase of the feed rate of up to 100% compared to conventional ISO inserts.

- The VPGT 1003... F provides a sharp cutting edge for semi-finishing, finishing and micro-finishing.
- The VPET 1003... F provides a sharp cutting edge and the tolerance of its insert height is more precise. This is an advantage as the height does not have to be reset when changing the insert.
- The VPXT 1003... E is a directly pressed insert with rounded cutting edge for roughing and semi-finishing.

Advantages:

- Front turning, back turning and facing with one insert
- Carbide grades and coatings for steel, stainless steel and superalloys
- Cutting edge radius from 0 to 0.35 mm available as standard
- Heat-treated holders and boring bars
- Reinforced "V" type holders for front turning with high depths of cut

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

"TWIN" holder with and without integrated coolant supply

The "TWIN" range allows you to work with two inserts on the same holder. Different combinations are possible, and provide the user with a high degree of flexibility. Holders are available with shank cross-sections of 8 to 20 mm, with and without internal cooling.

Advantages:

- Twice the number of tools on the machine
- Two different turning operations are possible with a single tool holder
- All holders with an integrated coolant supply have five connecting options

"Y-AXIS" holder with and without integrated coolant supply

Y-AXIS holders solve the chip control problems that can occur when cutting long-chip materials. With the Y-AXIS holder, the cutting edge is offset by 90° compared to the standard holder, whereby the chips fall in the bed of the machine. This prevents troublesome tumbling and flowing chips that can become caught on the cutting edge and damage it.

Benefits:

- Suitable for long chipping materials
- The problem of chip control is solved
- Holders with internal cooling
- All holders feature five possible connectors for the coolant supply

"FC" holder with quick cutting edge change system (fast change)

The cutting edge can be changed without unclamping the holder using the "FC" holder. The indexable insert is mounted using a specially developed knee lever which is operated using a clamping screw on the rear of the holder.

Advantages:

- Quick indexable insert change directly in the machine
- Holder with and without integrated coolant supply

* Description TOP □ 25

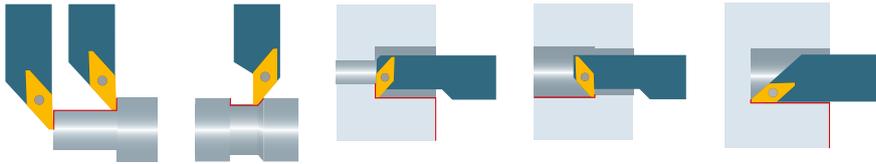

Application range of chip breaker

- Properties:**
- polished rake and ground clearance
 - sharp cutting edge "F"
 - submicrograin carbide, high toughness
 - TOP system, for a better surface finish
 - Closer tolerance "E"

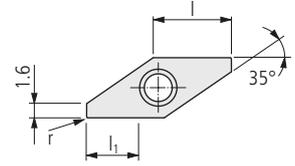

- Application:**
- finishing for 20–100% higher feed rates compared to the standard
 - chip breaker for general application
 - stainless steel, alloyed steel and super alloy

* Description TOP □ 25

Application range of chip breaker

Properties:

- polished rake and ground clearance
- sharp cutting edge "F"
- submicrograin carbide, high toughness
- TOP system, for a better surface finish

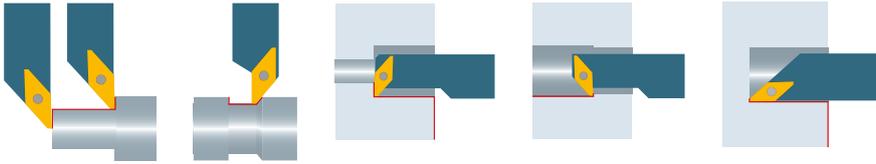

Optimal chip breaking

Application:

- finishing for 20-100% higher feed rates compared to the standard
- chip breaker for general application
- stainless steel, alloyed steel and super alloy

* Description TOP □ 25

Application range of chip breaker

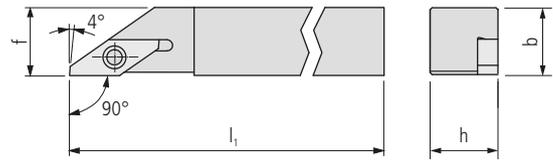

- Properties:**
- high precision sintered insert
 - rounded cutting edge "E"
 - submicrograin carbide, high toughness and hardness
 - TOP system, for a better surface finish
 - best performance-cost ratio

Optimal chip breaking

- Application:**
- finishing for 20-100% higher feed rates compared to the standard
 - chip breaker for general application
 - alloyed steel, stainless steel and super alloy

Spare parts (clamping bolts/screws) □ 323

* Note

With this holder, the indexable insert is secured with a screw using a knee lever that can be operated from behind. This means the holder does not have to be unclamped to change the cutting edge.
 Tighten the clamping screw to 1.2 Nm using a torque screwdriver.

Spare parts (clamping bolts/screws) □ 323

* Note

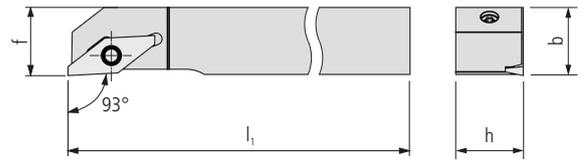

With this holder, the indexable insert is secured with a screw using a knee lever that can be operated from behind. This means the holder does not have to be unclamped to change the cutting edge.
 Tighten the clamping screw to 1.2 Nm using a torque screwdriver.

Reinforced version V and version "FC" (fast change) with internal cooling

Usage notes:

To avoid problems, two Y-AXIS holders must not be mounted directly next to each other.

Mount a standard tool holder between the Y-AXIS holders.

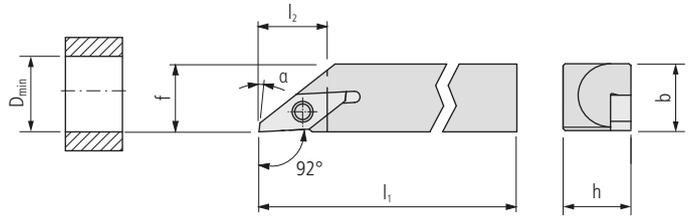

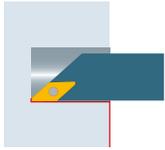

To prevent collisions, move back the holder in accordance with the overhanging length before changing the tool position.

Scope of delivery: Holder without coolant connector
Coolant connectors □ 632

Feed (f) and depths of cut (a_p) □ 178...

multidec®-BORE MICRO provides a wide range of inserts for miniaturized ID-turning (diameter between 0.5 and 8 mm). Sharp edges, small radii and ground surfaces guarantee accurate cutting. multidec-BORE MICRO is excellent for machining of common materials as well as exotic alloys. multidec®-BORE MICRO carbide tools are available with wear-resistant coatings as well as uncoated. The heat-treated tool-holder SDA ... can be fixed in a usual chuck or ID tool station. The inserts can be replaced by hand without any measuring or adjusting of axial and radial position. The unique clamping nut ensures accurate location of the boring tool and prevents vibration.

326

UTILIS
multidec[®]
swiss type tools

Advantages:

- For internal machining methods with small diameters:
 - high positioning accuracy
 - internal cooling system and
 - smallest internal diameter of 0.5 mm
- Sharp cutting edges
- Different coatings are available
 - tenacious carbide grade
 - coated and uncoated

The Superclamp holder offers higher holding forces and better stability, needed especially for broaching, hard cutting with CBN and machining of finest surfaces with PCD, CVD-Diamond and MCD, in non-ferrous materials.

AKR-Mono is a holder for use on the outside turning position when no more inside holder fixing space is available.

SDU – SDV (Threading)

Application recommendation for number of passes at threading □ 164

Polygonal punching is a chip-removing procedure for manufacturing of inside profiles in holes which are usually not continuous. During this procedure, the tool is pushed into a hole in several so-called strokes, and the outline of the broaching tool is introduced into the workpiece.

We can supply square, hexagonal and TORX broaching tools made from carbide from our standard product range. We can also manufacture customised shapes and intermediate sizes on request.

Benefits:

- Short machining times
- Complex geometries with sharp edges are possible
- Full profile tools reduce the number of strokes
- Reliable process with long tool life

UTILIS multidec®
swiss type tools

multidec®-DRILL contains of a wide range of high-precision solid carbide drills and centre drills. This includes the range from Ø 0.5 to 5 mm and centre drills with tip angles of 90°, 120° or 140°. multidec®-DRILL is characterised by its high stability and precision, and makes a decisive contribution to achieving high quality because of its excellent positioning capability and self-centering characteristic, and makes the work easier. The design also provides good chip removal and the tool life is increased significantly because of the coating (HX).

366

Benefits:

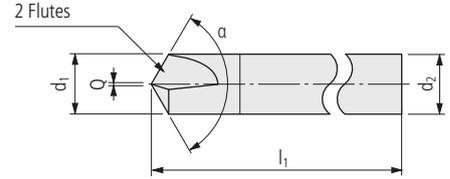

- High degree of accuracy and stability
- Self-centering
- Excellent positioning capability
- Good chip removal
- Complete range of solid carbide twist drills from Ø 0.5 - 5 mm
- Centre drills with tip angle of 90°, 120° or 140°
- Coating (HX) for longer tool life
- Diameter coordinated to metric thread sizes
- Intermediate sizes possible on request

In thread milling, the thread is produced by helical interpolation. The cutting process enables threads with one or two teeth to be obtained with a nominal diameter of 1 mm or more.

Advantages:

- The thread depth is equal to the drill depth
- Lower torque than with tapping and roll form tapping
- Short milling chips avoid chip problems
- High Speed Cutting (HSC) possible
- Reliable process with longer life time

$$v_f = z \cdot f_z \cdot n_1$$

$$n_1 = \frac{v_c \cdot 1000}{\pi \cdot d_1}$$

$$n_2 = \frac{v_f}{\pi \cdot d_1}$$

Explanation

- v_f Feed (mm/min)
- d_1 Tool diameter (mm)
- n_1 Tool revolutions (rev/min)
- d_4 Work piece diameter (mm)
- n_2 Revolutions (rev/min)
- v_c Cutting speed (m/min)
- P Pitch (mm)
- l_1 Length of one milling pass (mm)
- z Number of teeth
- d_3 Drilling diameter (mm)
- f_z Feed per tooth (mm)

Determine the drilling diameter

For the preparation of drilling before thread whirling, it is necessary to know at first the tolerance of the desired thread. To avoid overload of the tool the diameter must not exceed the max. diameter as mentioned in the following table.

Example: M 1.4, pitch 0.3, tolerance desired of the thread 6H on high level (1.11)
 Diameter of the hole to be drilled min = 1.11 – (2 × 0.04) 1.03 mm minimum

Engraving is a chip-removing procedure for which ornaments, text and decorations are cut into the material. The removal of the material creates a surface structure which visually stands out against the background. Engravings manufactured in this way have the advantage of greater durability than other procedures.

The product range includes standardised, finished-ground carbide gravers which provide extremely good performance in all materials and also pre-ground semifinished products for grinding yourself.

**Benefits:**

- Standardised tools with point angle of 30° for engraving from 0.2 to 2 mm
- Pre-ground blanks, with lapped chip surface, available for individually grindable tools
- Sharp cutting edges
- Reliable process with long tool life

multidec®-WHIRLING is a multiple cutter thread whirling tool system designed to significantly improve productivity – essential in today's mass production. Unlike single point threading which requires multiple passes, thread whirling produces a finished thread free from burr in a single pass. The use of up to 12 cutting inserts greatly reduces machining time. For optimized use, UTILIS supplies variants for specific machines with different cutting diameters and lengths.

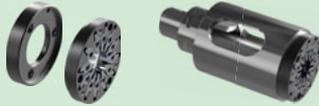

The inserts used in multidec®-WHIRLING are based on those in multidec®-CUT. This groove/lathe tool system is ideal for Swiss type turning machines with a maximum bar passage diameter of 10 mm. The inserts have two cutting edges that are screwed onto the holders with a repeat accuracy of <math>< 0.01\text{ mm}</math>.

Specialities and advantage:

- Up to 12 inserts increase productivity and reduce vibration considerably
- Little concentricity tolerance and high exchange accuracy of inserts $< \pm 0.005\text{ mm}$ guarantee threads of high-quality
- Quick and simple change of the Whirling tool reduces set up time
- Threads without cutting ridge decrease re-machining of parts
- Using UTILIS standard blanks allows short delivery time and best possible coating for demanded application
- Whirling tools with different flight circles and multi start threads available

MWT... (Type A)

xModular-System

Flexible, two-part system, which reduces set-up time with the fast change whirling ring (the adapter remains in the whirling device); guaranteed concentricity of $\pm 0.005\text{mm}$.

MWT... (Type B)

Mono-system

Highly compact single component system. This enables high concentricity of $\pm 0.005\text{mm}$ to be achieved.

MWT... (Type C)

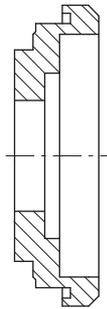

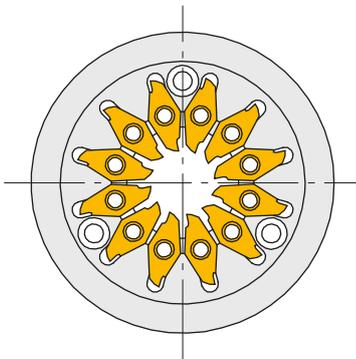

QuickChange-System

Unlike the xModular-System the whirling ring is removed or inserted by rotation. Here too, the guaranteed concentricity of $\pm 0.005\text{mm}$ is maintained.

 UTILIS
multidec
 swiss type tools

The multidec®-WHIRLING box contains tools for daily use on the machine. The protective foam inlay ensures that the parts are always located at the same place in the case. Spaces are provided for the whirling head for specific applications and the matching whirling plates (4 unmounted sets in all). Dummies can be supplied optionally to protect vacant plate positions.

Illustration with whirling head and plates (these have to be ordered separately)

Contents:

- Handle for torque screwdriver 1.2 Nm
- Alternative torque screwdriver blade for Torx screws
- Allen key
- High performance grease
- Spare screws for the whirling adapter and whirling ring
- Spare Torx screws for the indexing plates

STARTER-SET

Order designation

Starter-Set

The digital inclinometer gives you more flexibility in machine set-up and adjusting the thread pitch angle. The calculation and complicated movement by a certain distance are not required, particularly since the space situation in machines is not always the best. The UMI DI-490 (MEMS principle = Micro-Electro-Mechanical System) consists of a compact housing. Three magnets on the underside makes the attachment in the machine compartment easier. The zero point can be calibrated and stored internally, in order to change between relative and absolute measurement at any time.

**Product description**

Development and production of multidec® tools for your own specific needs.

Customer's situation

A special machining method makes it impossible or difficult to use tools from the standard multidec® range. You need a special insert, a special tool or coating which is not included in our standard product range.

UTILIS solution

After detailed consultation, we will develop and make the best multidec® solution for your particular needs. Normally this will be done using standard blanks which enable the special tools to be produced and delivered quickly and at reasonable cost. The familiar multidec® quality is of course always guaranteed.

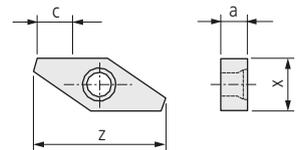

Advantages:

- UTILIS know-how and quality also for special tools
- Standard blanks permit fast and reasonably priced delivery
- Tools developed to meet your specific needs

UTILIS
multidec®
swiss type tools

$$\tan \delta = \frac{P}{\pi \cdot d_4}$$

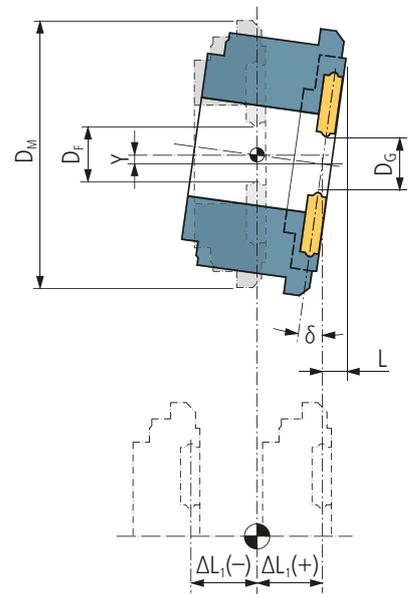

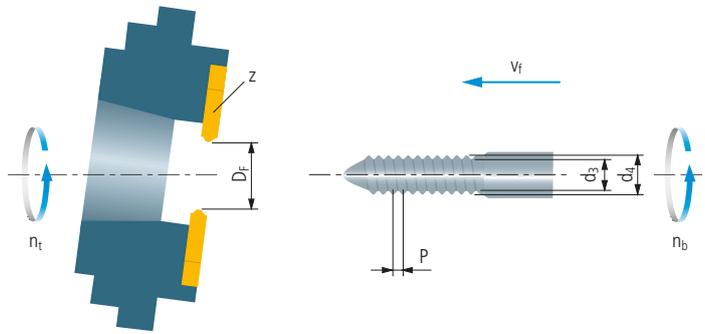

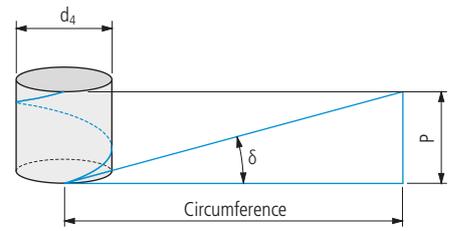

$$\delta = \frac{\arctan \cdot P}{\pi \cdot d_4}$$

$$v_f = z \cdot f_z \cdot n_t$$

$$n_t = \frac{v_c \cdot 1000}{\pi \cdot D_F}$$

$$n_b = \frac{v_f}{\pi \cdot d_3}$$

$$Y = \sin \delta \cdot \Delta L_1$$

Please visit our website www.utilis.com for further thread whirling calculations

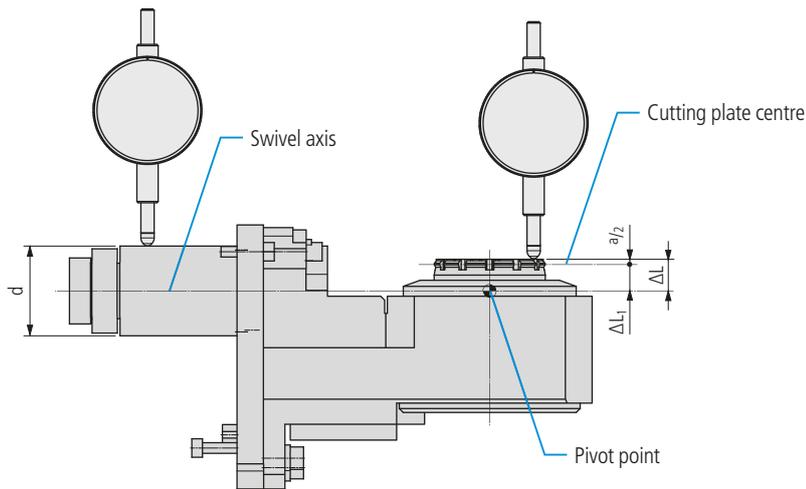

Explanation

- d₃ Core diameter (mm)
- d₄ Thread diameter of work piece (mm)
- D_F Flight circle (mm)
- D_G Max. bar passage diameter (mm)
- D_M Ring diameter outside (mm)
- f_z Feed per tooth (mm)
- L Overhang length (mm)
- ΔL₁ Positioning relative to the pivot point (mm)
- n_t Tool revolutions (rev/min)
- n_b Work piece revolutions (rev/min)
- P Pitch (mm)
- v_f Work piece feed (mm/min)
- v_c Cutting speed (m/min)
- Y Tip height adjustment
- z Number of teeth
- δ Lead angle (°)

The measurement of the length difference ΔL_1 is appropriate for determination when the following situations exist:

- New whirling tool or holder
- Checking the ΔL_1
- After a machine collision
- Point height compensation

Outside the machine the length difference ΔL_1 must be determined using the height measuring device for calculating the point height and correcting it if necessary using the following procedure:

1. The swivel axis is usually the centre axis of the arbor. In order to do this, the diameter d must be measured and halved. This position must be zeroed and used as a reference for further measurement.

2. We take the uppermost surface of the cutting edge as the second measuring point. The difference results in ΔL

3. Use dimension $a/2$ (half the cutting edge width) in accordance with the whirling tool designation for the remaining calculation. The length difference ΔL_1 is calculated from this, whereby the exact point height compensation can be adjusted.

See usage examples □ 485

| Whirling tool designation | $a/2$ | ΔL | $\Delta L_1 = \Delta L - a/2$ |

Tool Systems enables UTILIS inserts to be used on various well-known lathe tool systems. High quality UTILIS inserts like multidec®-CUT, -TOP and -BORE MICRO can therefore also be fitted on other manufacturers' cutting tool interfaces. This gives users maximum flexibility and independence. On the following pages, UTILIS proposes a wide range of holders for tool systems and machine-based tool systems.

multidec®-SHORT is a range of holders with short holders multidec®-CUT, -ISO and -TOP indexable inserts. All holders are equipped with internal cooling.

**Benefits:**

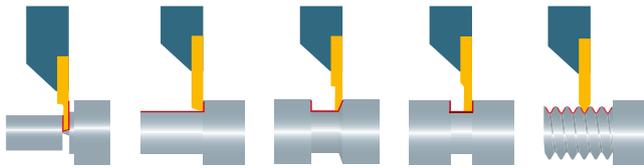

- All holders feature three connecting options for the coolant supply
- Fixed coolant discharge, therefore low build-up at front at the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

Compatibility with QS quick tool change system:

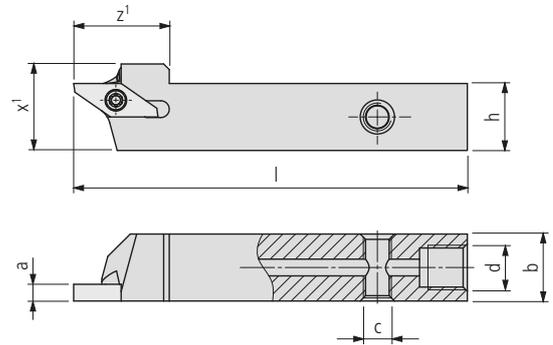

multidec®-SHORT holders can also be used in the QS quick tool change system from Sandvik Coromant. The coolant transfer tube can be screwed into the holder at the rear fur using the internal coolant supply.

TORX screwdriver  665

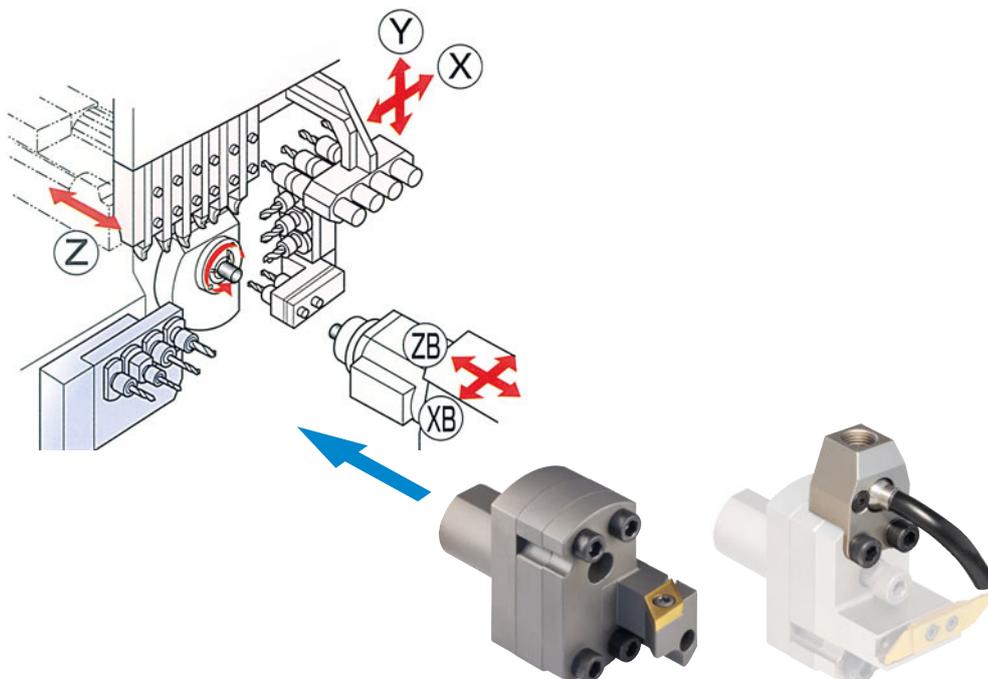

multidec®-BACKTOOLS is a product range used for reverse-side machining on Swiss type turning machines with counter spindles. The tool enables a part to be fully machined in a single operation.

This modular system is characterized by outstanding stability and versatility.

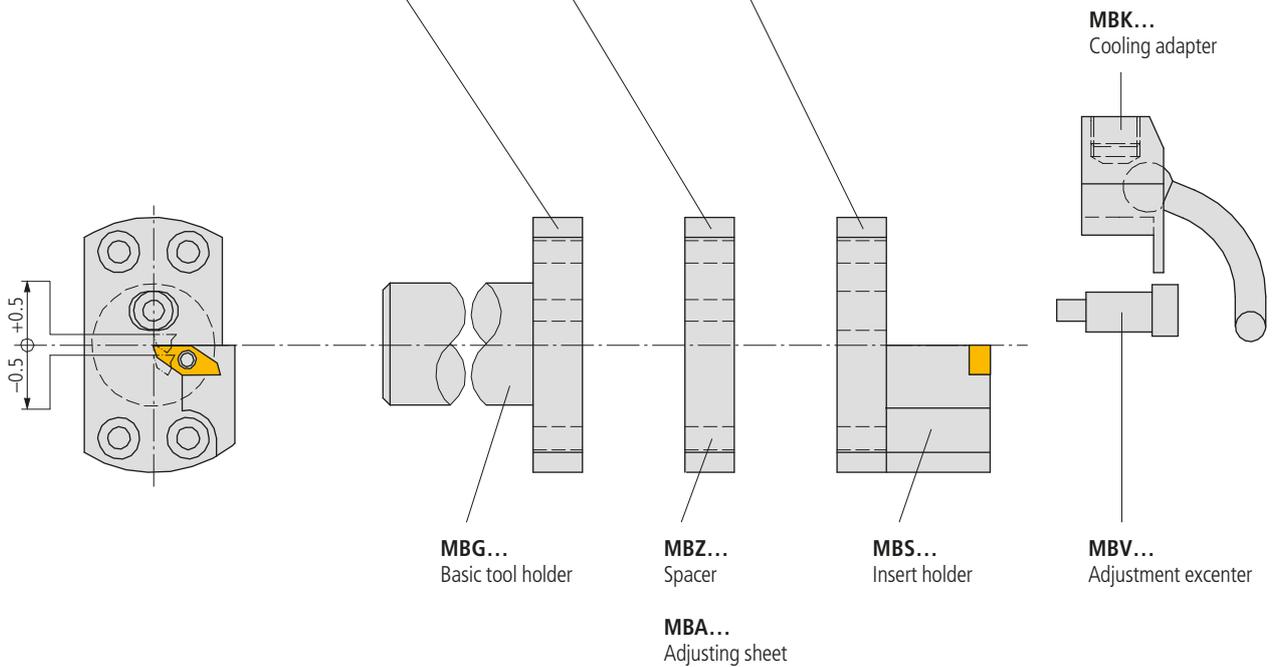

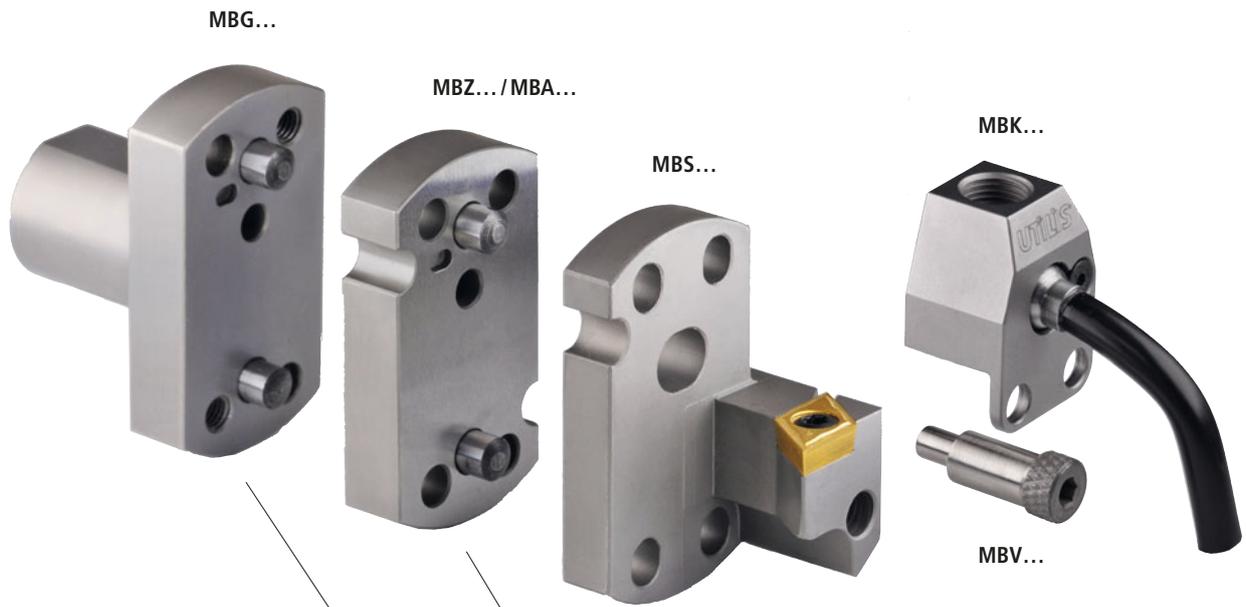

Advantages:

- Complete machining in a single operation is possible
- High stability
- Modular design
 - Basic tool holder
 - Spacer
 - Insert holder
- Precise and convenient center height adjustment by means of an eccentric screw for machines without Y-axis (± 0.5 mm)
- Internal cooling possible
- Basic tool holder for common machines

TORX screwdriver  664

multidec®-MODULINE is a modular tooling system with an ideal range of options designed to meet the requirements of different machines available on the market.

Grooves along the length of its base ensure excellent rigidity and precise positioning. Longitudinal positioning is ensured by a fixed (...f) or adjustable (...a) peg held in place under pressure by a sprung bearing.

A specific MODULINE tool holder plate can replace the original plate. This way, gains in reliability and tool changeover speed are very high.

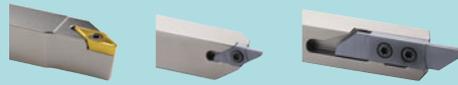

Special features and advantages:

- More tool holders per available space bring a significant productivity gain
- Easy and quick tool replacement, with presetting on fixed or adjustable length
- Stable and reliable tool location system with longitudinal serrations and large square shanks
- Versatile tooling system, easy to use, possible combination with standard tools and coolant supply devices
- Wide range of holders for multidec®-ISO, -TOP and -CUT inserts
- Applitec-compatible

TORX screwdriver  664

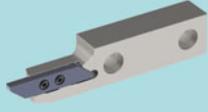

multidec®-TECKO is a modular tooling change system from automatic-lathes with the advantage to increase the number of insert-holders in the machine. The system consists of base plates adapted on the current machines and insert-holders, which can be fixed fast and with high precision, due to the two "Quicklock"-screws.

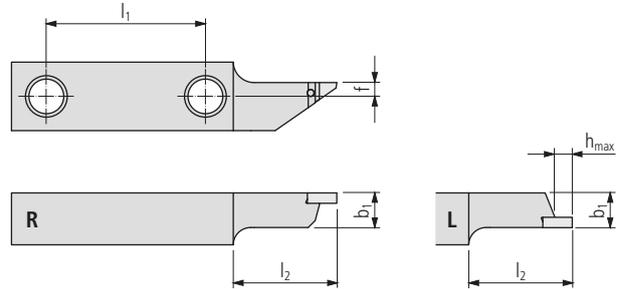

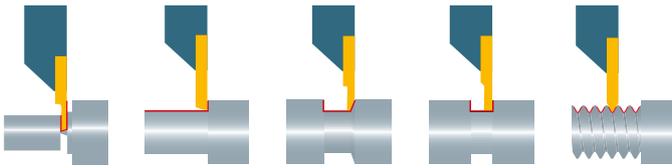

UTILIS propose adapted toolholders for inserts multidec®-CUT and multidec®-TOP.

**Advantages:**

- Quick and accurate change of toolholders
- Nickel plated toolholders made from heat treated steel
- Utilisation of high quality multidec® inserts

multidec®-KM™ is a precise and robust quick-change system for automatic lathes with an interface to ISO standard 26622.

For the KM Micro, KM Mini and TS systems UTILIS offers suitable holders for multidec®-CUT, multidec®-TOP inserts and for multidec®-BORE MICRO cutting edges.

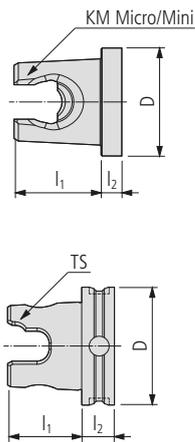

TS

KM is a Trademark of Kennametal Inc.

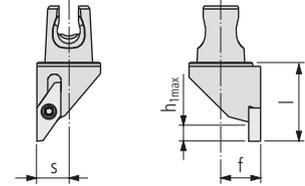

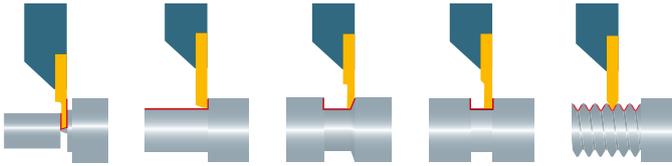

Advantages:

- Fast and simple installation of KM basic tool holders into the existing tool positions
- Quick tool changes
- Heat-treated steel tool holders with internal cooling
- High-quality multidec® cutting edges

TORX screwdriver  664

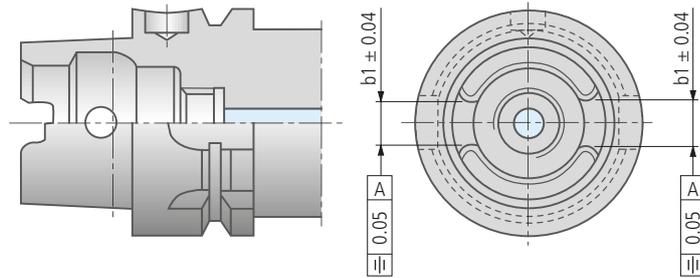

Use of the multidec®-HSK-system with ISO 12164/DIN 69893 standardized attachment has become increasingly widespread in recent years. This system makes the customer independent from specific tool system, which is a great advantage. Simplicity, precision and reliability; these are the criteria that customers place on modern tool systems. HSK tools largely satisfy these demands and help to maximize productivity. The program comprises a wide selection of tool holders for both OD and ID turning on lathes. The standard range has been developed in size 32 and form "C" for manual tool changing. Now we propose a new size 40 in form HSK-T for the automatic- and manual tool change. Other HSK shapes and sizes are available on request.

**Advantages:**

- Large program of toolholders in heat-treatable steel, with internal cooling, available from stock
- Holder with high rigidity and repeat accuracy
- High precision in positioning of cutting edge, cause of the axial positioning and the close tolerance of the holder keyway HSK-T standard ISO 12164
- Utilisation of high quality UTILIS multidec®-inserts

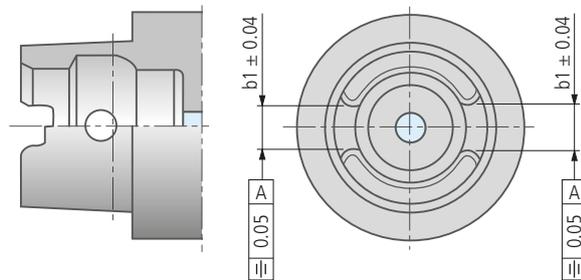

| | | |
|-----------------------------|--|-----|
| Technical information | | 9 |
| HSK-versions |  | 562 |
| Holders (IOD turning) |  | 564 |
| Holders (ID turning) |  | 568 |
| Closing plug |  | 570 |
| Replacement and spare parts |  | 571 |

HSK – Form A

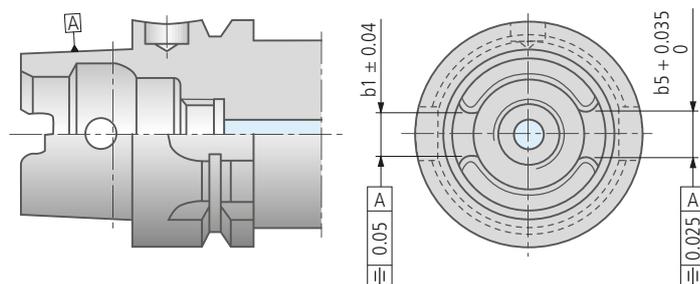

- Used on machining centers, milling machines, turning machines, special machines with automatic tool change
- Central, axial coolant supply through coolant tube
- Torque transmission via two key slots at end of taper
- Two slots on collar for tool magazine, location edge hole for data carrier in collar

HSK – Form C

- Preferably used for spindles on transfer lines and special machines without automatic tool change or for short bore spindles and tool extensions and reductions
- Central, axial coolant supply
- Torque transmission via two key slots at end of taper

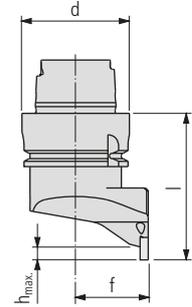

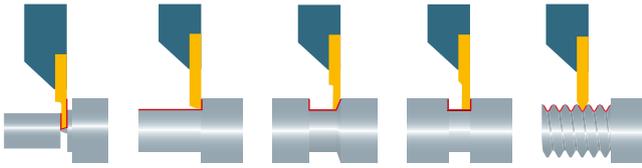

HSK – Form T

Tighter tolerance for perfect change precision

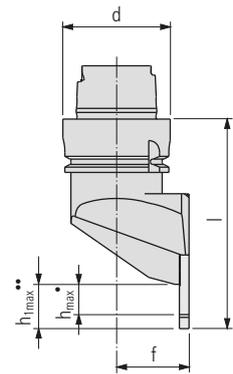

The "T" stands for "Turning". HSK-T combines the basic shape of the HSK taper in form A/C and differs by closer tolerances of the cam grooves on the cone of the tools.

This important feature for turning assures accurate radial positioning (center height).

TORX screwdriver ☐ 664

multidec®-PSC is a flexible and modular quick change toolholder-system, with a polygon-connection compliant with ISO 26623-1 standard. High torque transmission is one basic advantage of the system. The program includes tool holders suitable for turning machines with multidec®-CUT, multidec®-TOP and multidec®-BORE MICRO inserts.

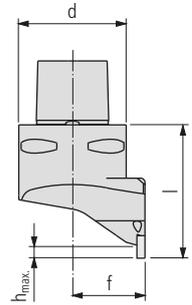

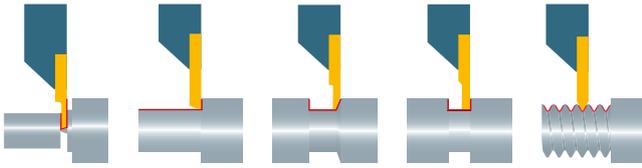

Advantages:

- Connection with high rigidity, repeat accuracy and self-centering
- Quick change of toolholders
- Toolholders with heat-treatable steel and internal cooling
- Utilisation of high quality multidec® inserts

TORX screwdriver  664

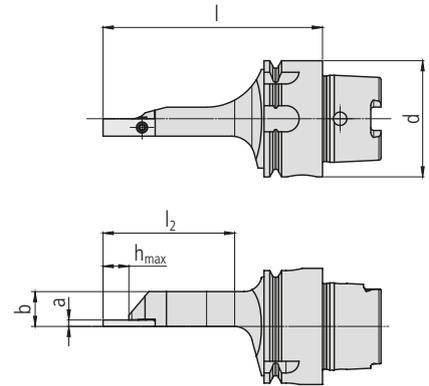

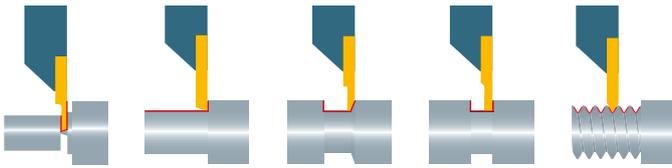

Solid and compact tools are an enormous advantage for turning operations on multitask machines. Specially-designed tools must be used with the machine spindle during the turning process that can allow work to be done very close to the main or opposed spindle. Any errors in the height of the cutting edge and torsional forces should also be kept to a minimum.

With the HSK-E40, HSK-T32, HSK-T40, HSK-A40 and PSC 40 (Capto C4) spindles, this sophisticated range of tools offers ideal solutions for modern turning and milling centers.

**Advantages:**

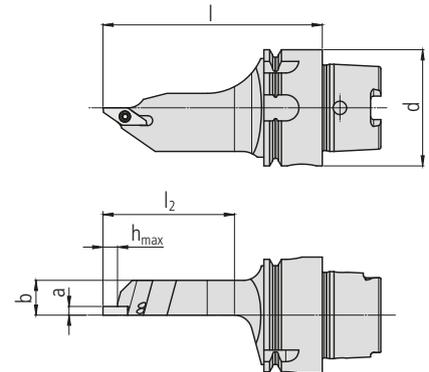

- Monoblock tools with interchangeable inserts
- Compact and solid design
- The insert is positioned on the center line (guaranteeing a very accurate cutting edge height and high repeatability while also reducing of the load on the spindle)
- All tools are equipped with integrated coolant supply
- The high quality UTILIS inserts from the multidec®-CUT, -ISO, -TOP and -BORE MICRO series can be used

TORX screwdriver  664

ESCOMATIC machines are known as versatile and flexible automatic turning centers for the low cost manufacture of complex work pieces in small and large batch sizes. Material is fed from the coil with a straightening unit or from a bar loader. UTILIS has developed a range of insert holders for various machine types.

Advantages:

- elaborate program of toolholders, available from stock
- nickelized toolholders with heat-treatable steel
- utilisation of high quality multidec® inserts
- quick change of inserts in the machine or presetting outside of the machine
- significant reduction of machine downtimes

For the rotating tool heads of machine types ECO8, EC12, Newmach NM 64X and NM 6 Flexi, the program includes tool holders which are suitable for multidec®-CUT, multidec®-TOP and ISO standard inserts.

For the machine type D6, we recommend a new exchange kit. This new holder and insert system will replace the old system with monobloc tools.

ESCO offers a modification of the existing chuck on the D2, D4 and D5 machine types, where the basic holders for the cranks can be replaced with insert holders. Following this modification, holders for UTILIS inserts can then be attached.

Important: In order to guarantee perfect functionality, modifications may only be made by ESCO. UTILIS only supplies the holders and the corresponding inserts.

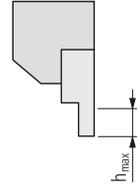

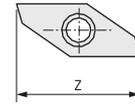

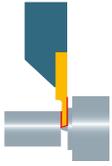

The following machine types can be modified:
D2, D2 Flex Speed, D5 Flex Speed, D2-CNC, D2-CNC-UP, D4, D5, D5-CNC, D5-Twin and D5-Ultra

| ESCO D2-R-6353-1 CUT 1600 R | | | ■ | D2, D4, D5 | 15 | 5 | | 16... |

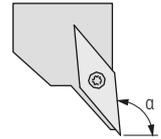

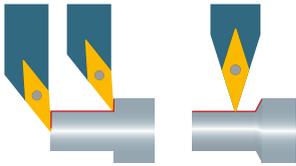

* Attention

The total length (z) of the CUT 16... cutting edges is 15 mm. If this length falls below any significant extent, the travel distance of the holder may no longer be sufficient to reach the centre. In this case, a switch to another holder for shorter indexable inserts must take place.

Cut-off operation near the spindle or the sub-spindle is frequently difficult with standard-tool holders. The cutting edge is too far away or the tool holder collides with the spindle. Adapted special tool holders are the solution in this case.

This program proposes to use multidec®-CUT and -TOP inserts, adapted tool holders and modules for machines of DECO 7, DECO 10, EvoDECO 10, DECO 13, EvoDECO 16, DECO 20, DECO 26 and EvoDECO 32.

TORNOS

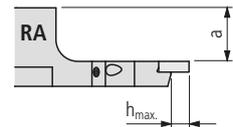

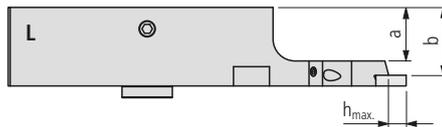

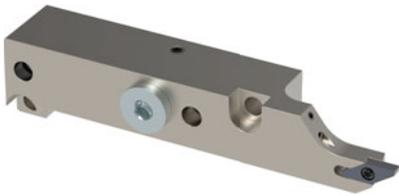

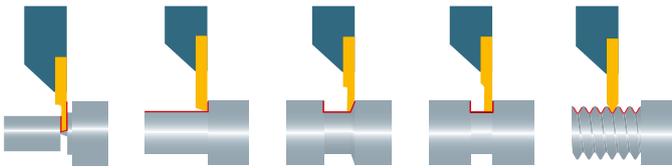

Advantages:

- Adapted tool-holders with internal cooling, nickel plated and made from heat treated steel, available from stock
- Increased stability by direct attachment of tool holders on the machine base plate
- Cutting edge near the spindle/sub-spindle
- Cut-off of small parts without problems
- Utilisation of high quality multidec®-CUT inserts

The multidec®-LUB clamping shim directs the coolant precisely onto the tool insert, even at low pressure. The flexible stop allows for the tool holder to be replaced safely and quickly. The supply of coolant under high and low pressure is made through a distributor block or directly in the multidec®-LUB clamping shim.

Coolant distributors with two to eight outlets, hoses in a range of different versions and lengths, plus diverse fittings and quick couplings are available as accessories for complete high-pressure and low-pressure solutions.

Benefits:

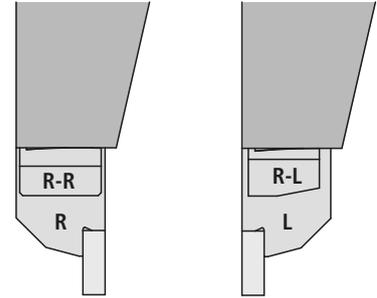

- Simple installation through replacement of the original clamping shim with the multidec®-LUB clamping shim
- The service life of the insert is increased as the removal of chips and heat is improved thanks to the precise positioning of the cooling on the cutting edge
- Increased process reliability
- Use of the clamping shim at pressures of 30 to 200 bar or 435 to 2900 psi
- Quick and safe replacement of the insert thanks to integrated stop
- Tool holders without internal cooling (IC) can continue to be used
- The clamping shim can be used under high and low pressure
- For right-hand and left-hand tool holders
- the clamping shim has two connecting options for the coolant supply
- Different coolant distributors, hoses and push-in fittings for high and low pressure
- Torque screwdriver for precise clamping of the tools

In order to determine the correct multidec®-LUB clamping shim, we require the exact dimensions of the tool plate and clamping shim. Therefore, please send these to us as a sample for measurement or use the form to send us the required information.

IMPORTANT:

The positions in the tool plate are not always identical. Therefore, measure the position where you want to use the multidec®-LUB clamping shim exactly.

The newly developed high-pressure solution from UTILIS (up to a maximum of 200 bar or 2900 psi) ensures optimal delivery of coolant to the insert.

The highly compact and robust design and the stainless steel finish are the main features of this product.

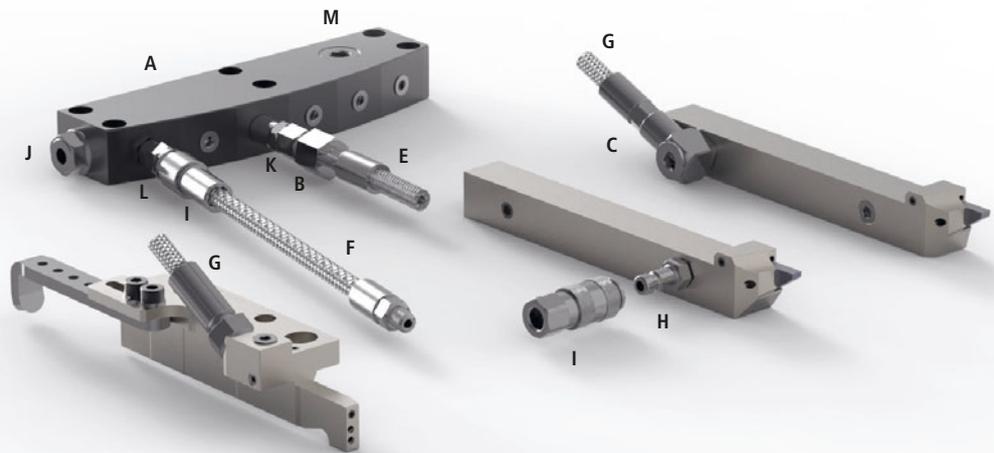

The product range includes several straight and pivoting unions with connection diameters of 4 mm and several quick connections. The use thereof dispenses with the laborious task of unscrewing the high-pressure tubes. This increases efficiency by minimising machine downtime.

The high-pressure hoses are available in a wide variety of lengths with different connections.

Reduction unions, extensions, screw connections, spare parts and coolant distributors round off the product range.

Benefits:

- flexible enough to be used with all multidec® product lines with internal cooling
- can be used within a temperature range of -60 to +250 °C or -76 to +482 °F
- can be used up to a maximum operating pressure of 200 bar or 2900 psi

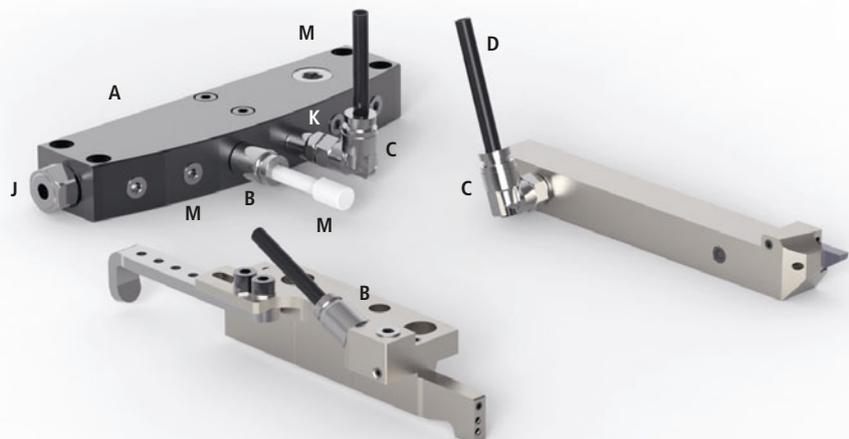

The range associated with the low-pressure solution for operating pressures up to a maximum of 30 bar or 435 psi includes a straight union and a swivel-type union with a connecting diameter of 4 mm when a polyurethane tube is being used.

As with our high-pressure solution, we offer reduction unions, extensions, closing plugs, and sealing rings. The polyurethane tube with an external diameter of 4 mm is 1000 mm long. This allows you to cut it to the length you need on a case-by-case basis.

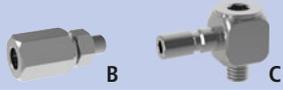

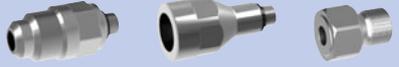

A well-balanced range of compact coolant distributors made of light metal completes the offer.

Benefits:

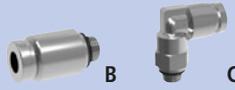

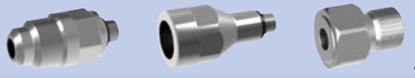

- flexible enough to be used with all multidec® product lines with internal cooling
- can be used within a temperature range from -40 to +100 °C or -40 to +212 °F
- can be used up to a maximum operating pressure of 30 bar or 435 psi (test pressure of 30 bar or 435 psi)
- corrosion-resistant and compact design

Example with unions

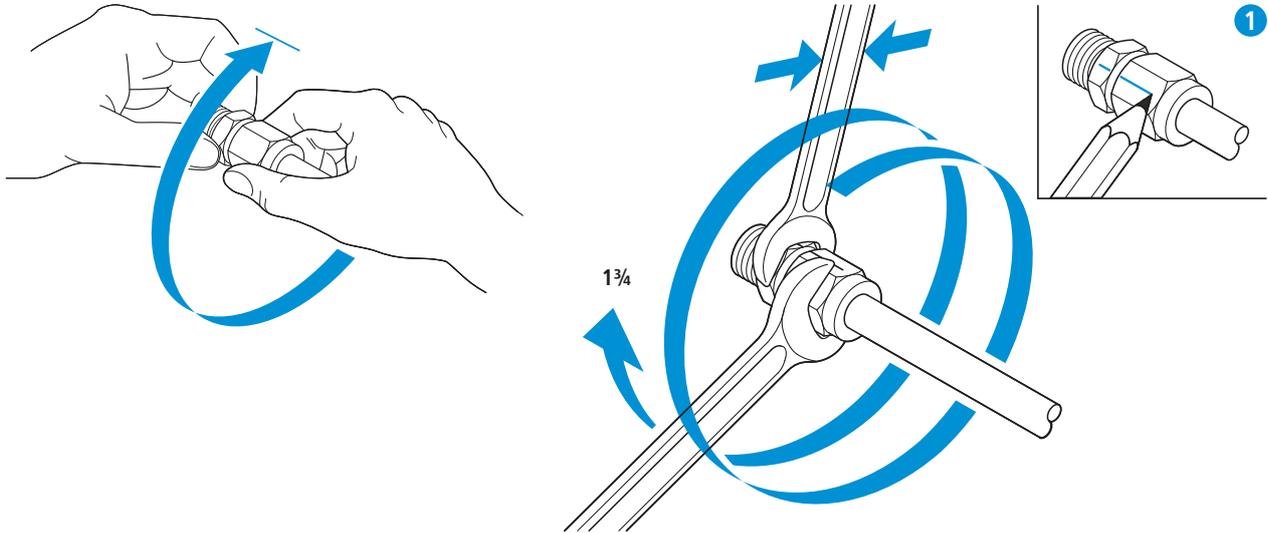

Example with quick connections

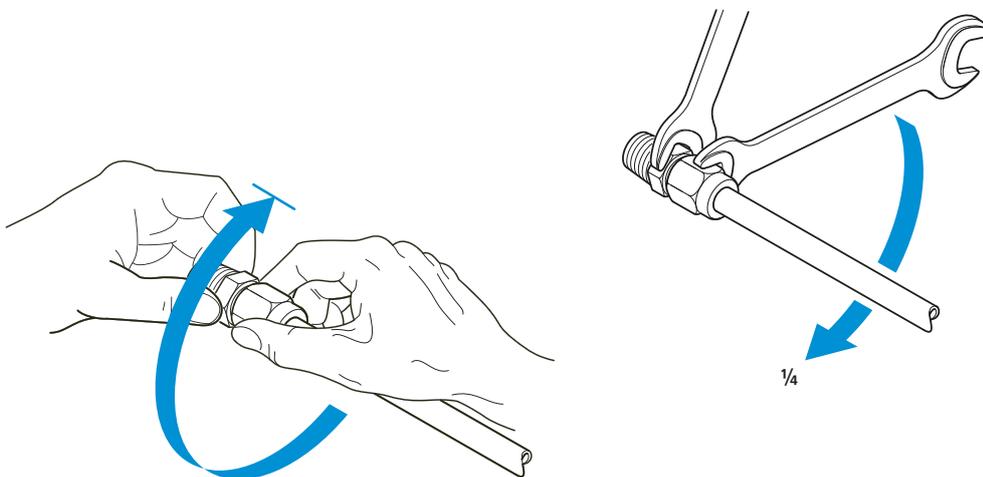

Initial assembly

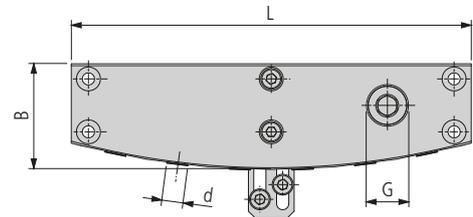

1. Screw on the union nut by hand until finger-tight. At the same time, push the tube against the fitting.
2. Tighten down the union nut through **1¾ rotations** using an open-end wrench.
 - ① Making a mark will assist in correct rotation. Hold the adaptor with a second wrench to prevent it turning.

**Repeat assembly**

When refitting the same tube union, screw the union nut back on by hand until finger-tight and tighten down the union nut with an open-end wrench with **¼ of a rotation** for the final fit.

In the event of repeat fitting, parts must be lubricated.

Installation of the straight plug connector

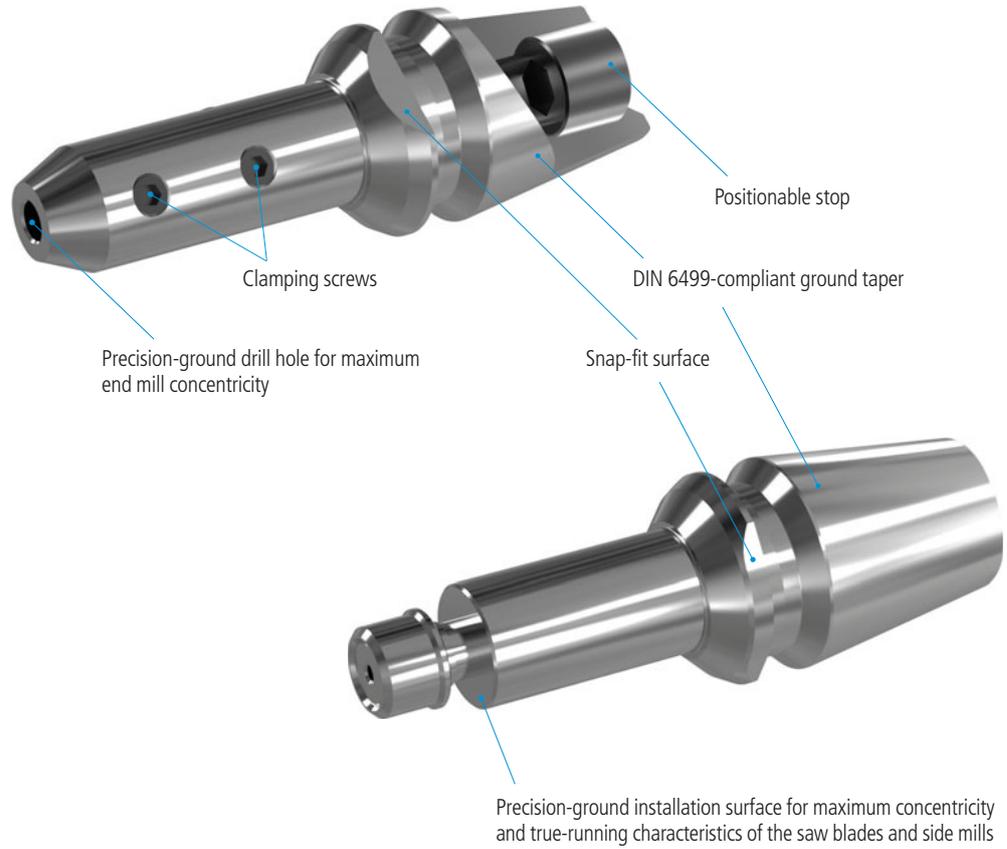

1. Screw on the straight plug connector by hand until finger-tight.
2. With the Allen key, thoroughly tighten the straight plug connector (as shown) through the opening for the connection using the force of your fingers only.

**Installation of the swivel-type plug connector**

1. Screw on the swivel plug connector by hand until finger-tight.
2. With an open-end wrench, thoroughly tighten the swivel-type plug connector (as shown) using a normal amount of force.

multidec®-TAPER-IN is a tool holder serie that has been specially developed to be used on Swiss type turning machines. These tool holders have a monoblock design in order to achieve the highest possible stability. The multidec®-TAPER-IN tool holders can be used in any driven or stationary spindle compliant with the DIN 6499 standard.

Benefits:

- Ideally suited to Swiss-type turning machines (profile turning)
- Direct fit in the collet chuck with ER cone
- No special clamping nuts are needed
- Monoblock design for reduced added tolerance
- High stability
- Ground surfaces
- Holder for ER sizes 8, 11, 16, 20 and 25
- Concentric accuracy of 0.005 mm
- Stop screw adjustable on both sides for tool positioning

Maximum possible hardness combined with high toughness are essential for any high quality tool. Use of a special alloy gives our blades exceptional toughness and elasticity even at a hardness of 58 to 60 HRC. The special surface structure of the handle gives a firm grip even with wet and oily hands. Safe working and a long tool life are guaranteed with this screwdriver.

These collets are made in-house by UTILIS and can be supplied from stock. They are manufactured for universal use with all screw-fitted milling cutters which have the same interface-specific application. To be used as ER adapters they offer several advantages, even by comparison with full carbide shank milling cutters.

Special features and advantages:

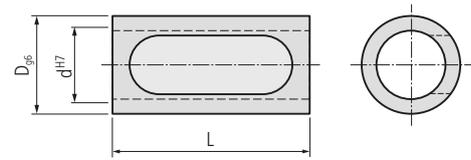

- Short and stable tool clamping
- Suitable for use on both, Swiss type lathes and regular short turning lathes
- Fewer vibrations than carbide endmill (less wear/tool breakage)
- Lower tool costs
- Higher cutting parameters than carbide endmill
- Also suitable for low power machines
- Concentricity <0.005 mm

The reduction sleeve gives the possibility fixing small tools in to the machine tool fixtures with bigger diameters. This small investment is an extremely flexible and economic solution giving an independent solution for different tool fixing situations.
